We are always on the frontier.

Development of Isotope-Microscopy and Implications for Cosmochemistry

Hisayoshi Yurimoto, Kazuhide Nagashima
Hokkaido University, University of Hawaii

Why do we need Isotope Microscopy?

Isotope Geochemistry

We are always on the frontier.

- Isotopes are used as tracers for
 - chemical reaction path, circulation of elements, origin of elements, and dating, etc.
- When solid phases are newly produced in an environment, the environmental change brings with variations of isotope ratios. The time variation are sequentially fixed in the growing solid.
- If we visualize 3-D distribution of isotope ratios in the solid, we learn the evolution of the environment. If the environment is open system, we learn origin of the element.

These are the reason why we need isotope-microscopy.

- However, the isotopic variation in nature is usually small (less than 1%). High precision measurements for isotope ratios are required.
- How to realize such isotope-microscopy?

Isotope Microscopy using SIMS
