Status and the challenges of the highest-energy Universe by observing cosmic rays

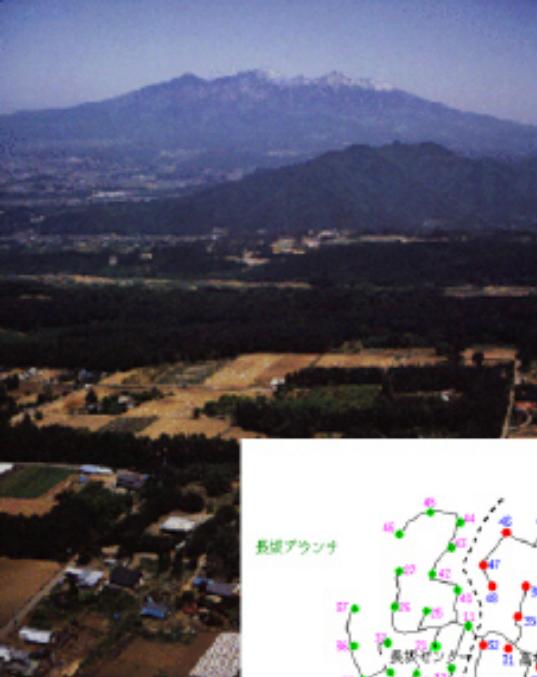

- LHC explores HIGGS, SUSY DM $< 7 \text{ TeV}/c^2 (\leq 10^{17} \text{ eV})$ from Dec 2007
- Highest energy CR: Unknown for origin, acceleration; physics unknown at $> 300 \text{ TeV}/c^2$

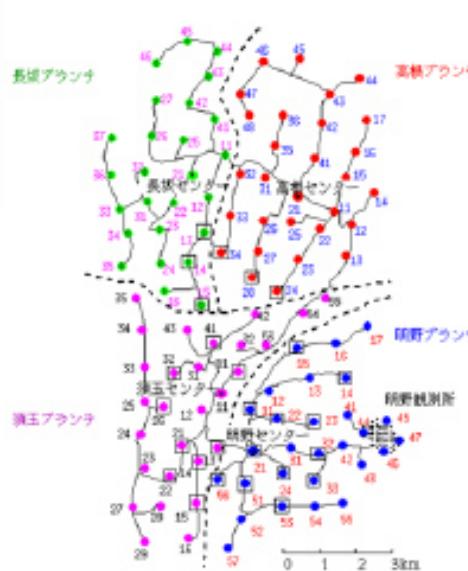

AGASA

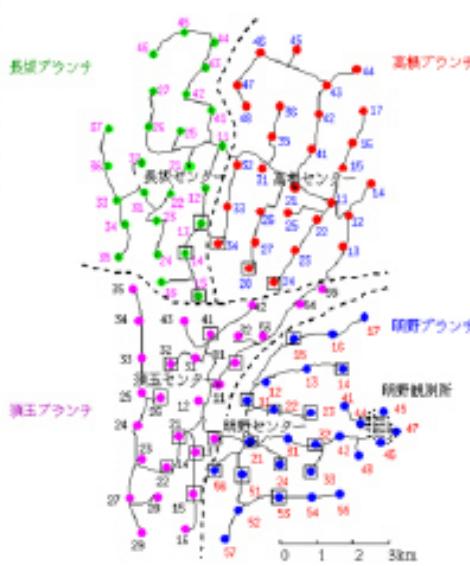

- 地域全体を検出器とした。
- 全体で約 100km^2
- 13年で11個の超 10^{20}eV 事象

AGASA

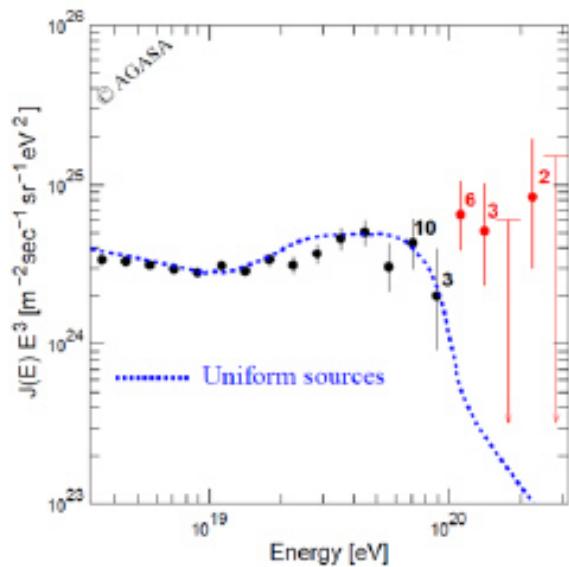

- ・ 地域全体を検出器とした。
- ・ 全体で約100km²
- ・ 13年で11個の超10²⁰eV事象

EUSOの観測方法

宇宙線が大気中に飛び込んで来て、空気シャワーをつくり、シャワー中の電子が窒素や窒素イオンを励起して蛍光を発する。

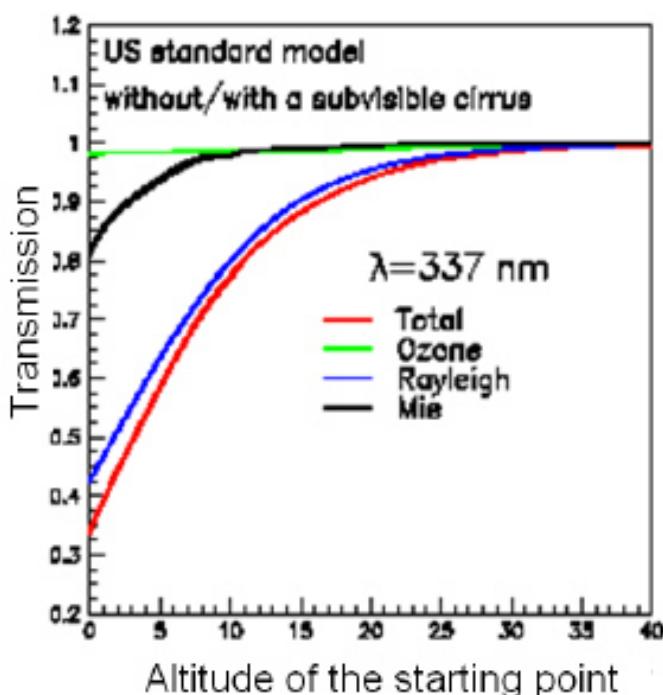

この蛍光を口径2.5mの望遠鏡で観測する。

空気シャワーにそって発せられたチエレンコフ光の地上や海上での反射光を観測する。

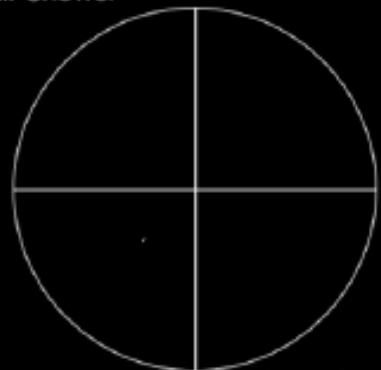

宇宙から見る利点

- 上層大気は希薄で散乱が少ない
 - 地上からだと汚い下層大気の吸収をこうむる
 - 10km先だと10%以下
- 夜は雲頂高度が低い
 - ほとんどは<3km
 - 空気シャワーの大部分は雲の上で最大を迎える
- 距離が決まっている
 - 軌道高度(400km)>>大気厚さ(10km)

EUSOの巨大な視野

EUSO ~ 1000 x AGASA ~ 30 x Auger

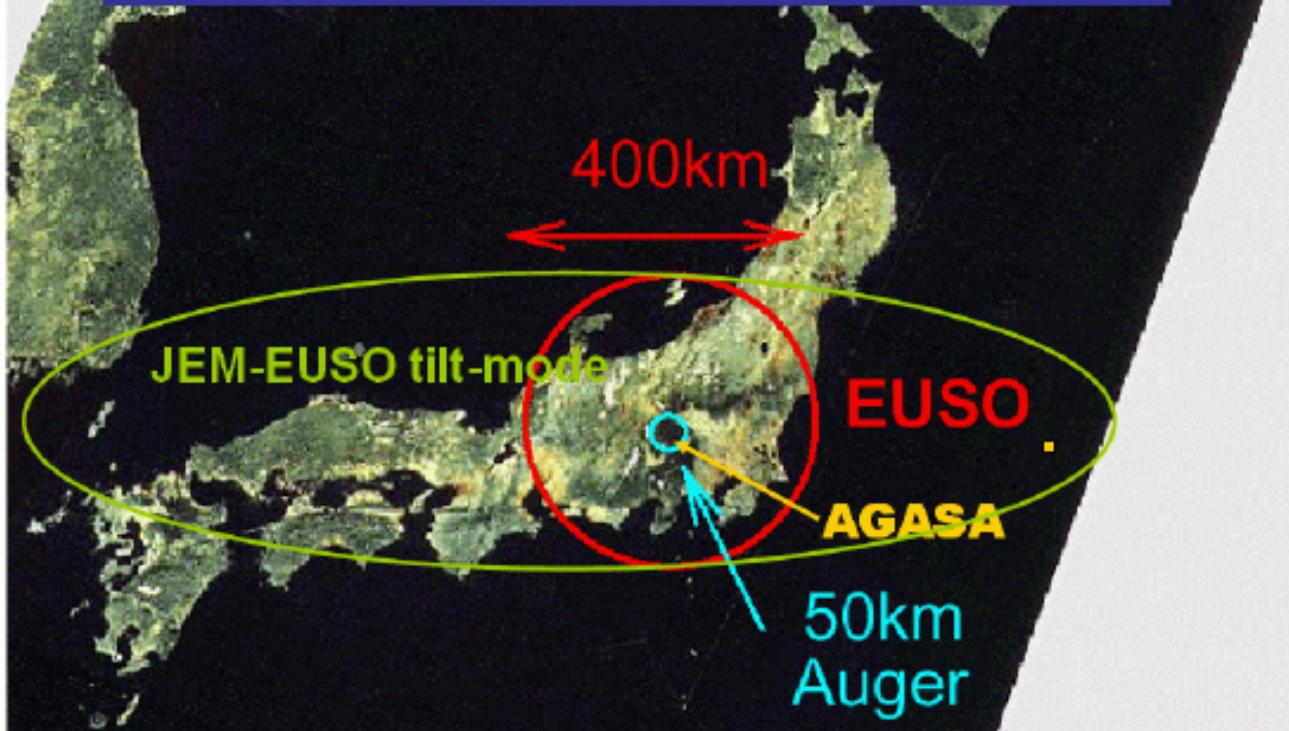

**EUSO (Instantaneous) ~ 5000 x AGASA
~ 150 x Auger**

EUSOの巨大な視野

EUSO ~ 1000 x AGASA ~ 30 x Auger

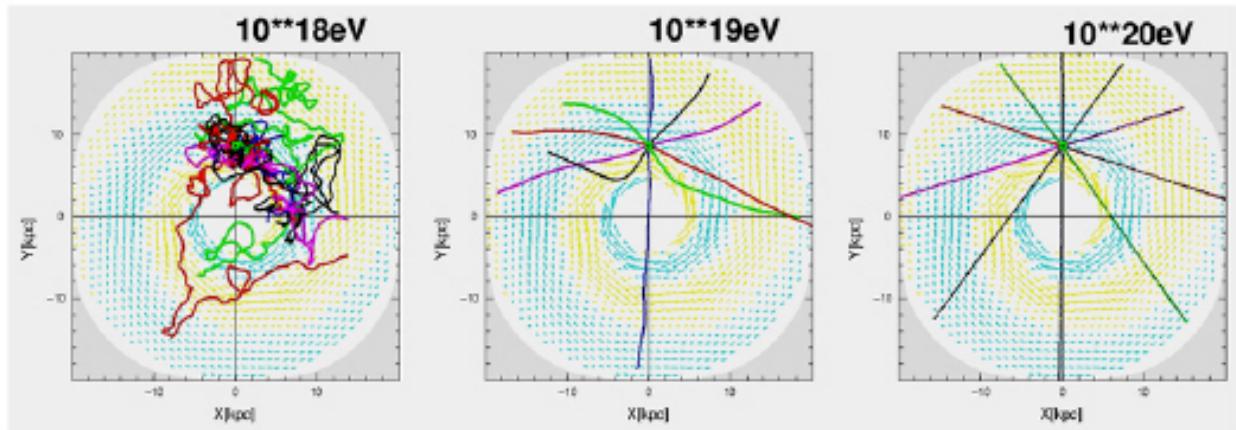

**EUSO (Instantaneous) ~ 5000 x AGASA
~ 150 x Auger**

科学目的

- 基本研究: 極限エネルギー粒子による新天文学
 - 高統計到来方向解析による起源天体の同定
 - 個別天体からのエネルギースペクトル測定による加速・放射機構の検証
- 探求的試験研究
 - 極限エネルギー宇宙ガンマ線の測定
 - 極限エネルギー宇宙ニュートリノの検出
 - 銀河磁場の構造と強度の推定
 - 相対論、量子重力効果の検証
 - 大気圏発光現象の研究

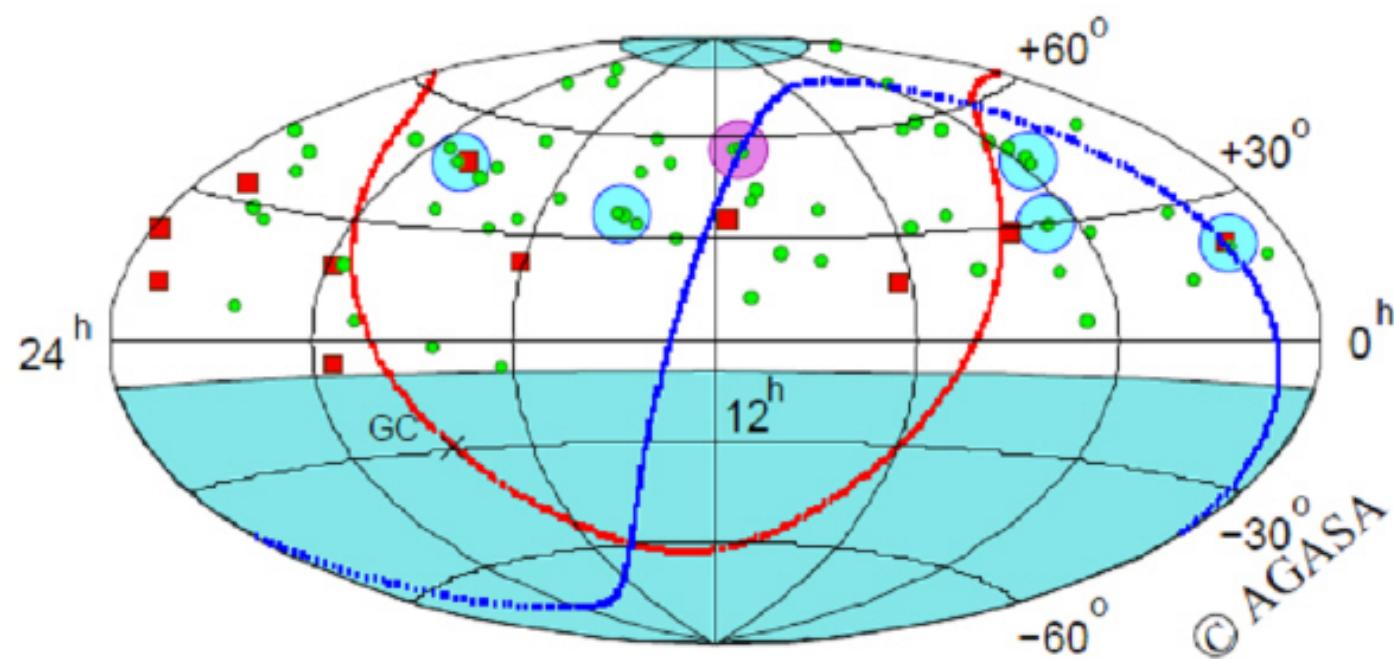

$E > 10^{20}$ eV 粒子は曲がらない

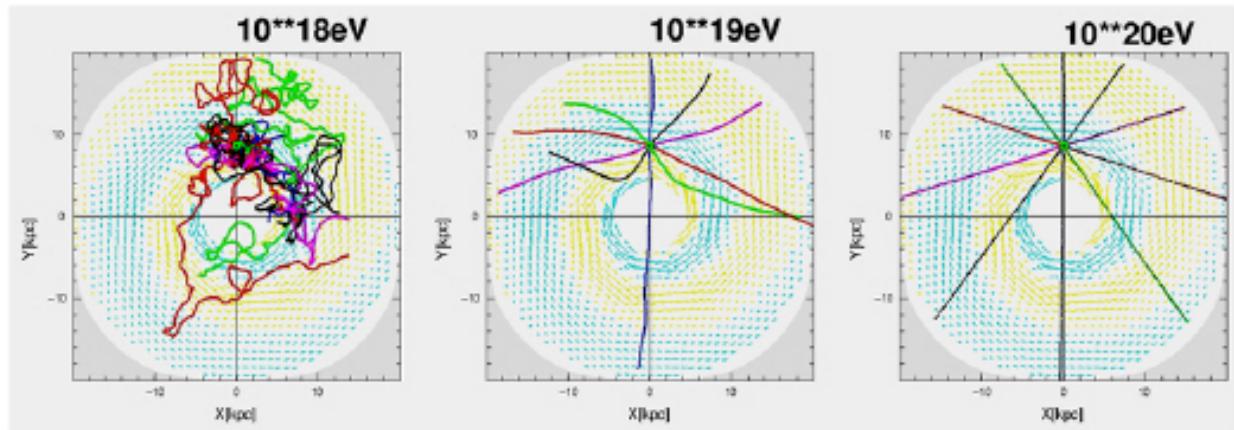

銀河内の伝播シミュレーション

到来方向解析により起源天体を特定：粒子天文学

Arrival Directions (AGASA)

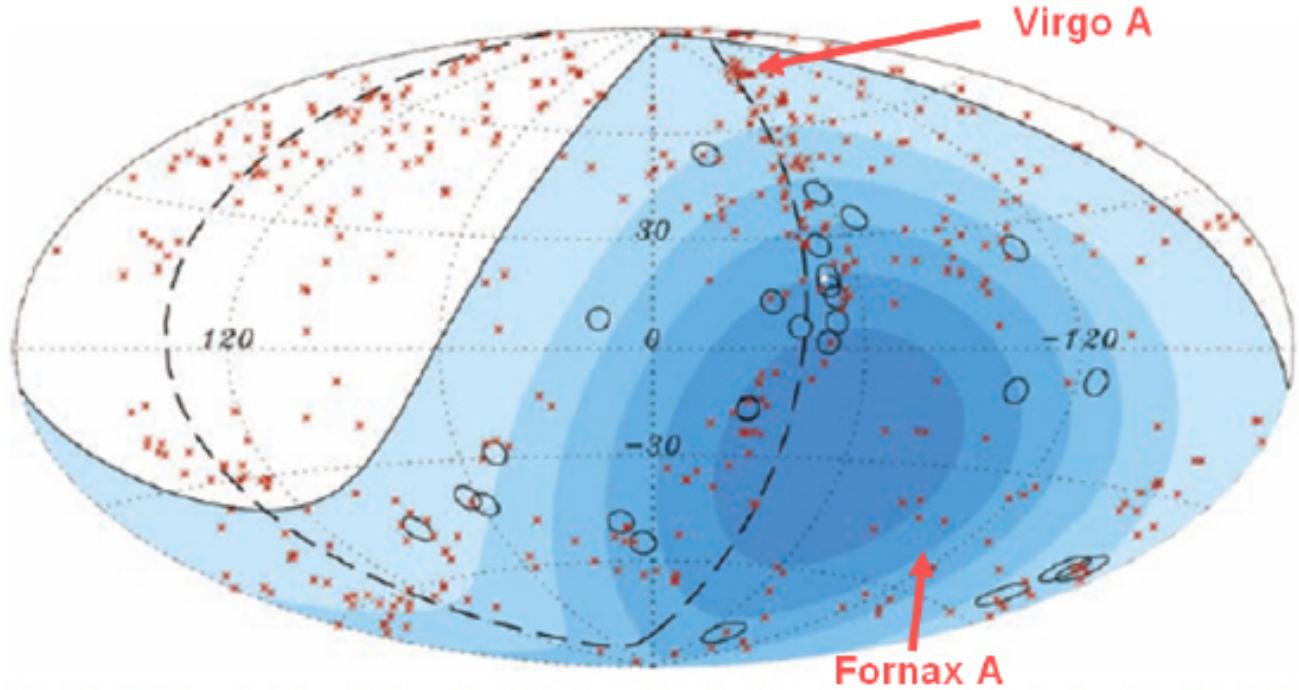

Fig. 2. Aitoff projection of the celestial sphere in galactic coordinates with circles of radius 3.1° centered at the arrival directions of the 27 cosmic rays with highest energy detected by the Pierre Auger Observatory. The positions of the 472 AGN (318 in the field of view of the Observatory) with redshift $z \leq 0.018$ ($D < 75$ Mpc) from the 12th edition of the catalog of quasars and active nuclei (12) are indicated by red asterisks. The solid line represents the border of the field of view (zenith angles smaller than 60°). Darker color indicates larger relative exposure. Each colored band has equal integrated exposure. The dashed line is the supergalactic plane. Centaurus A, one of our closest AGN, is marked in white.

EUSOの観測方法

宇宙線が大気中に飛び込んで来て、空気シャワーをつくり、シャワー中の電子が窒素や窒素イオンを励起して蛍光を発する。

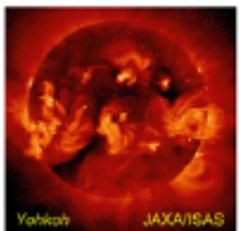

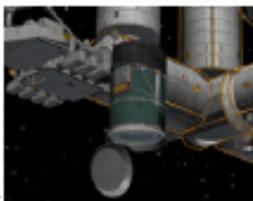

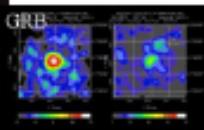

この蛍光を口径2.5mの望遠鏡で観測する。

空気シャワーにそって発せられたチエレンコフ光の地上や海上での反射光を観測する。

宇宙線が大気中に飛び込んで来て、空気シャワーをつくり、シャワー中の電子が窒素や窒素イオンを励起して蛍光を発する。

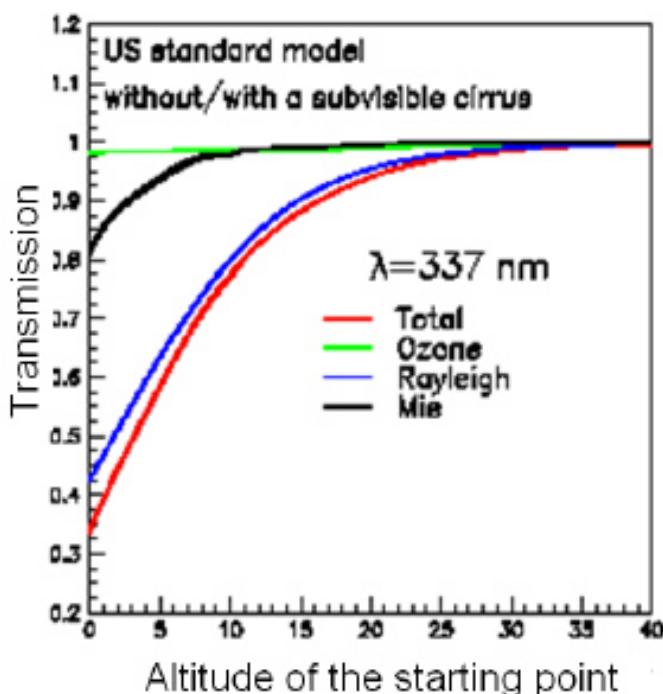

この蛍光を口径2.5mの望遠鏡で観測する。

空気シャワーにそって発せられたチエレンコフ光の地上や海上での反射光を観測する。

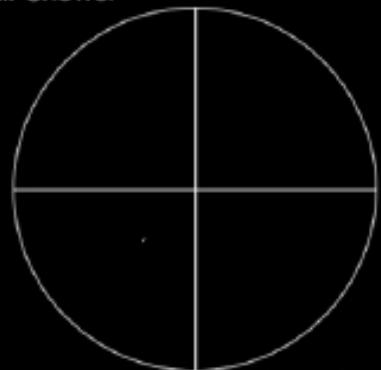

宇宙から見る利点

- 上層大気は希薄で散乱が少ない
 - 地上からだと汚い下層大気の吸収をこうむる
 - 10km先だと10%以下
- 夜は雲頂高度が低い
 - ほとんどは<3km
 - 空気シャワーの大部分は雲の上で最大を迎える
- 距離が決まっている
 - 軌道高度(400km)>>大気厚さ(10km)

Arrival Directions (AGASA)

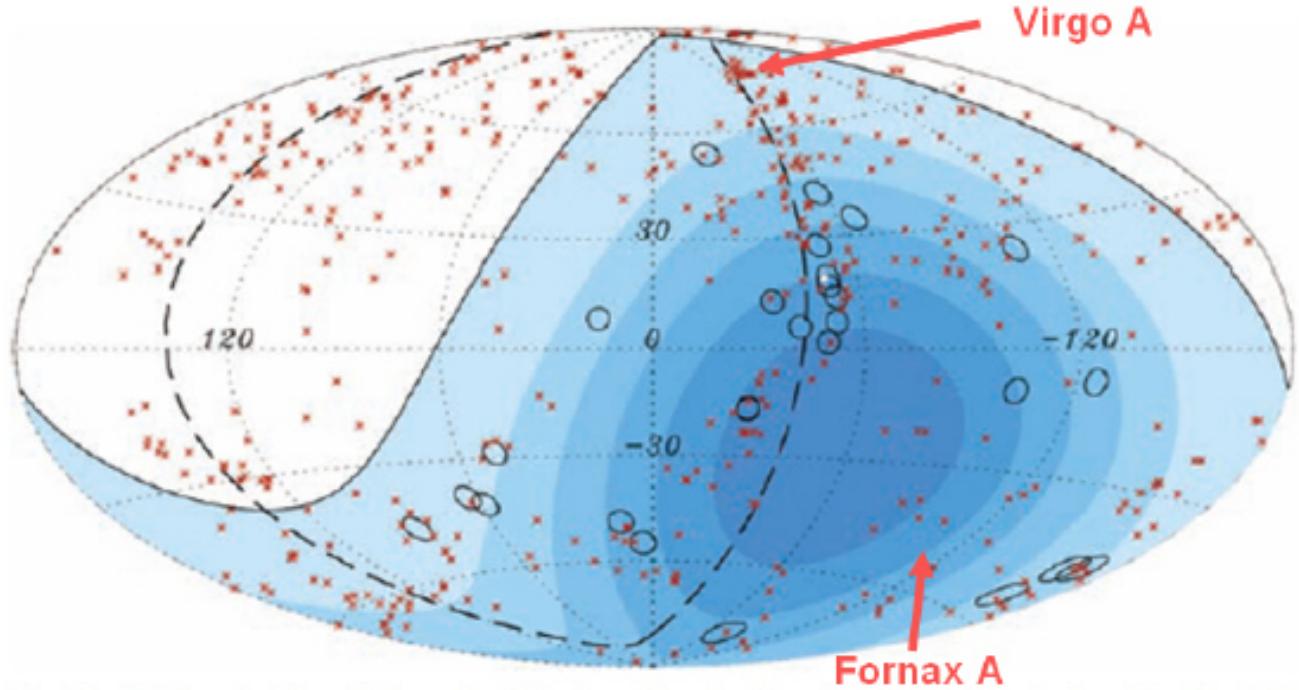

Fig. 2. Aitoff projection of the celestial sphere in galactic coordinates with circles of radius 3.1° centered at the arrival directions of the 27 cosmic rays with highest energy detected by the Pierre Auger Observatory. The positions of the 472 AGN (318 in the field of view of the Observatory) with redshift $z \leq 0.018$ ($D < 75$ Mpc) from the 12th edition of the catalog of quasars and active nuclei (12) are indicated by red asterisks. The solid line represents the border of the field of view (zenith angles smaller than 60°). Darker color indicates larger relative exposure. Each colored band has equal integrated exposure. The dashed line is the supergalactic plane. Centaurus A, one of our closest AGN, is marked in white.

 - 到来方向決定精度: 2.5度以下
- スペクトル解析
 - エネルギー決定精度: 30%以下
- ハドロン／光子／ニュートリノの識別:
 - シャワー最大深さ決定精度: 120 g/cm²以下

ミッション諸元

- 打ち上げ時期: year 2013
- 運用期間: 3 years (+ 2 years)
- 打ち上げロケット: H2B
- ISSへの運搬: HTV非与圧キャリア
- 装着場所: JEM EFU#2
- 軌道高度: ~430km
- 軌道傾斜角: 51.6°
- 質量: 1896 kg
- 使用電力: 998 W (operative),
344 W (non-operative)
- データ転送量: 297 kpbs

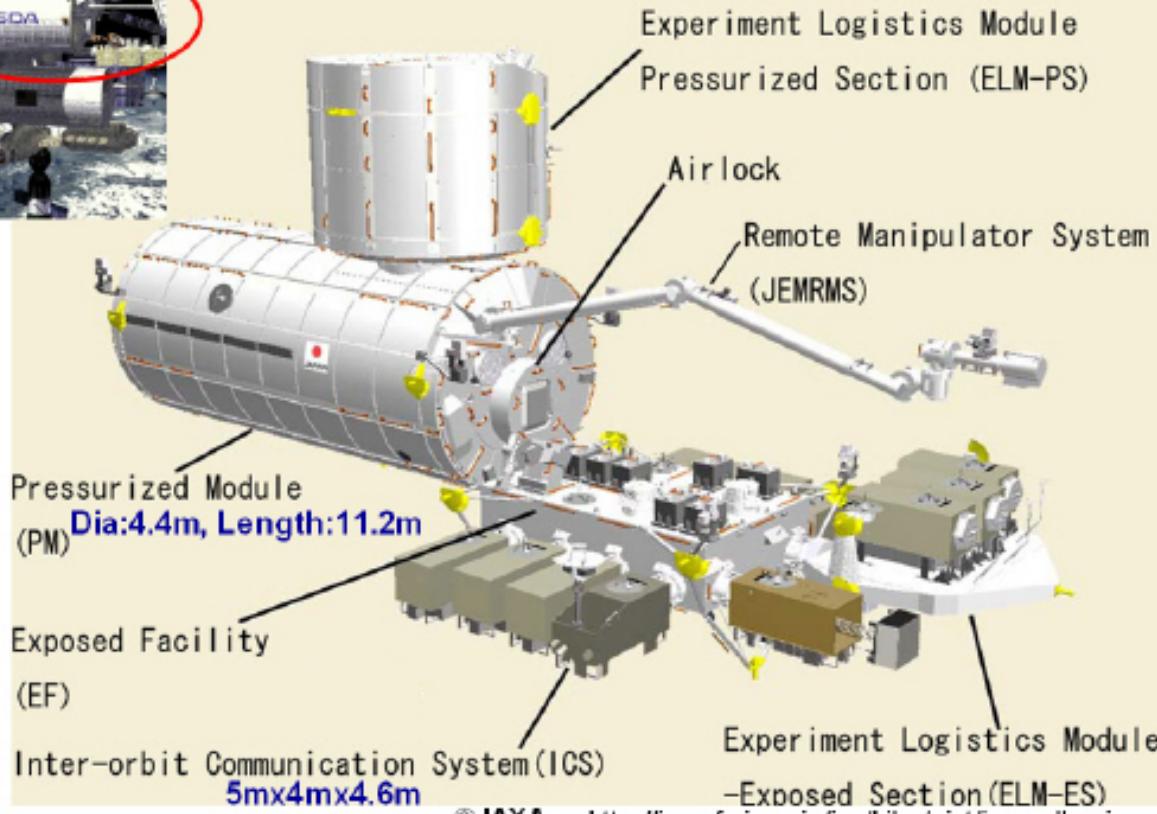

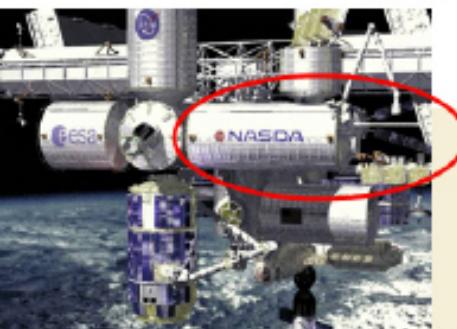

これまでの経緯

- **ESA-EUSO**
 - ESA 採択 2000;
 - NASA 採択 2003;
 - Phase-A 完了 2004
 - 地上公募研究: 1998 - 2001 2002 - 2004
- **2006年6月:**
 - JEM-EUSO WGが宇宙理学委員会において承認ISAS/JAXA
- **2006年8月:**
 - JEM-EUSO計画化委員会が理研中央研究所に設置
- **2006年11月:**
 - 第二期利用ミッション候補公募開始
- **2007年2月:**
 - 理研から提案書提出
- **2007年5月:**
 - 採択の正式通知
- **2007年6月**
 - Kick-Off会合
 - 国際アドバイザリボード会合
- **2007年7月**
 - 第一回国際JEM-EUSO会合(国際宇宙線会議@メキシコ)

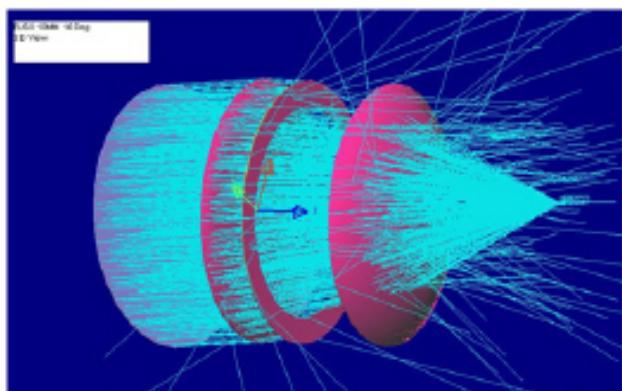

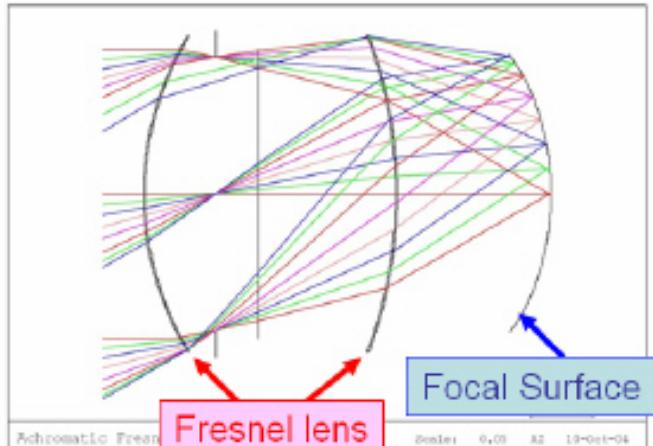

これからの予定

- 2007年度－2008年度(準備研究・概念設計)
 - 2007年10月 曝露部分科会へ報告
 - 2007年11月 国際JEM-EUSO会合
 - 2008年1月 国際アドバイザリボード会合
 - 2008年3月 国際シンポジウム開催
 - 2008年4月 中間評価
 - 2009年3月 最終評価
- 2009年度－2012年度
 - 製作段階
- 2013年 打ち上げ

IR Camera

Requirement

Item	Value	Reason
Wavelength	10 – 13 μm	Atmospheric transmission, S/N
FOV	> 60°	Same FOV as JEM-EUSO
Spatial Resolution	0.25°	1.8 km/pix @ nadir
Observation Temperature Range	200 – 320 K	Cloudtop temperature in troposphere
Absolute Temperature Resolution	< 3 K	Altitude resolution < 500m
IR Sensor	Uncooled Microbolometer Array	Mass, Power
Exposure Time	133 msec	ISS motion within $\frac{1}{2}$ - pix of IR camera
Observation Interval	30 sec (5 sec TBC)	ISS motion of JEM-EUSO $\frac{1}{2}$ FOV

IR Camera Development with EADS/SODERN

CIM01 (or IASI) onboard METOP1 satellite

IASA Specification

- Scanning Mirror
- Sensor (CIM01)

$\lambda :$ 10.3 - 12.5

μm

sensor: bolometer array

pix. size: 64×64

res.: 12 bit

FOV: $60 \times 60 \text{ mrad}$

NETD : $<80 \text{ mK}$

IR Camera Development with EADS/SODERN

Major Change from CIM01 to JEM-EUSO IR Camera

(1) Pixel size of detector

" 64×64 " → " 320×240 "

Boeing U3000A (320x240)

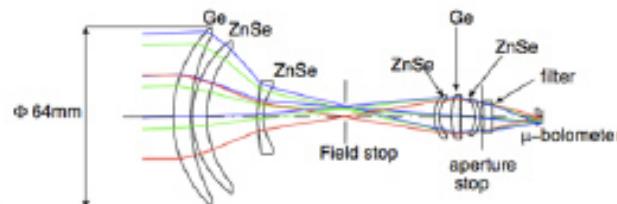

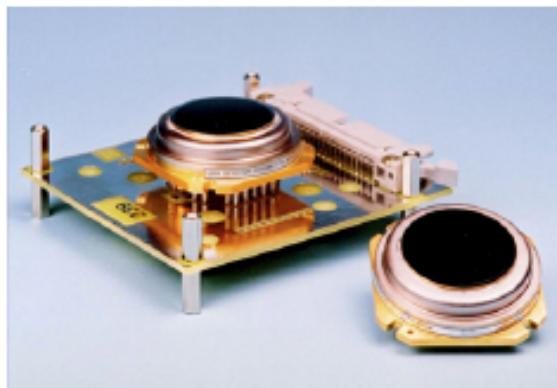

(2) FOV

Line scanning → $>60^\circ$

Based on CIM01 design, they can produce FM of JEM-EUSO IR camera with 5.5MEuro within 5 years.

Specification of IR Camera

Should be determined before 12E, 2007

Lidar

- Detected photoelectrons
 $N_{p.e.} = 1 \text{ (p.e./pix/GTU)}$
- Expected slow-data counts
 $N_{p.e.} = 50 \text{ (p.e./pix/50 }\mu\text{s)}$

Cloud top altitude: $\Delta h \approx 1 \text{ km}$

Specification

Item	Value	Reference
Wavelength	330 – 400 nm	
Spatial res.	800m x 800m	Same as JEM-EUSO detector
Detector	MAPMTs	
Resolution	8 bit	
Cloud top altitude determination res.	~ 1 km	IFOV of 1-pixel
Exposure gate time	50 μ sec	= 20GTU
Time interval	3.5 sec	ISS travel time of 1-PDM FOV
Data rate	35 kbps	

Tatiana UV Flash

- 雷雲と関係あると考えるのがもっともらしい
- 落雷との時間相関なし
- 雲-雲放電?
 - たくさんの小さな放電の寄与か

Narrow Bipolar Event

- FORTE衛星によるVHF観測
- 孤立した電波パルスイベント
 - 一般の雷のパルス列に先行
 - $T < 1 \mu\text{s}$
 - 10J-100J
- 可視光に対応する閃光パルスなし
- Runaway Electron Breakdown
 - Gurevich and Zybin 2004
 - 宇宙線空気シャワーがトリガ？
 - 電子が100–1000倍に増大
 - 近紫外で蛍光

NBEの伝播効果

NBEの空間分布

海上に多い？！

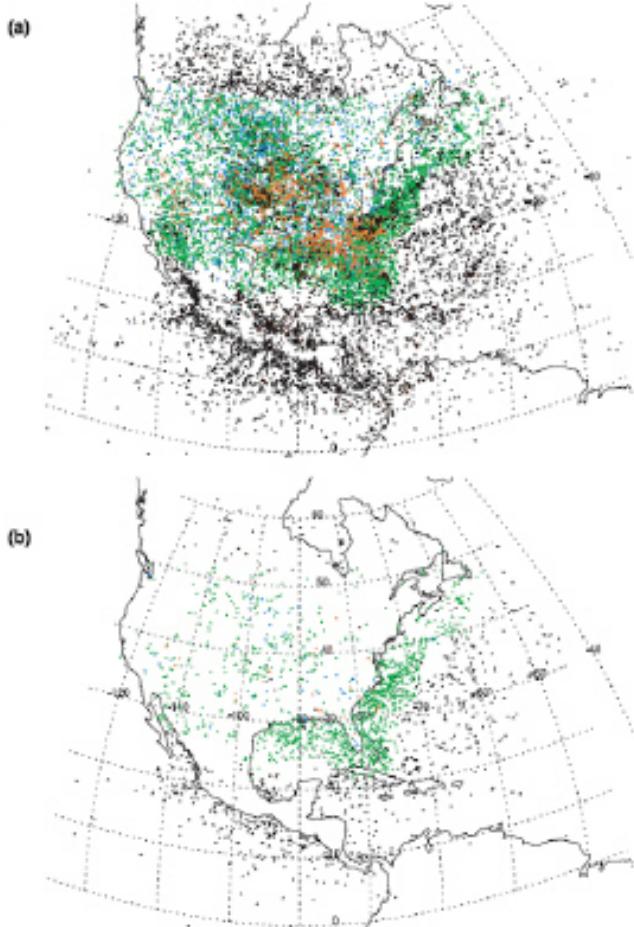

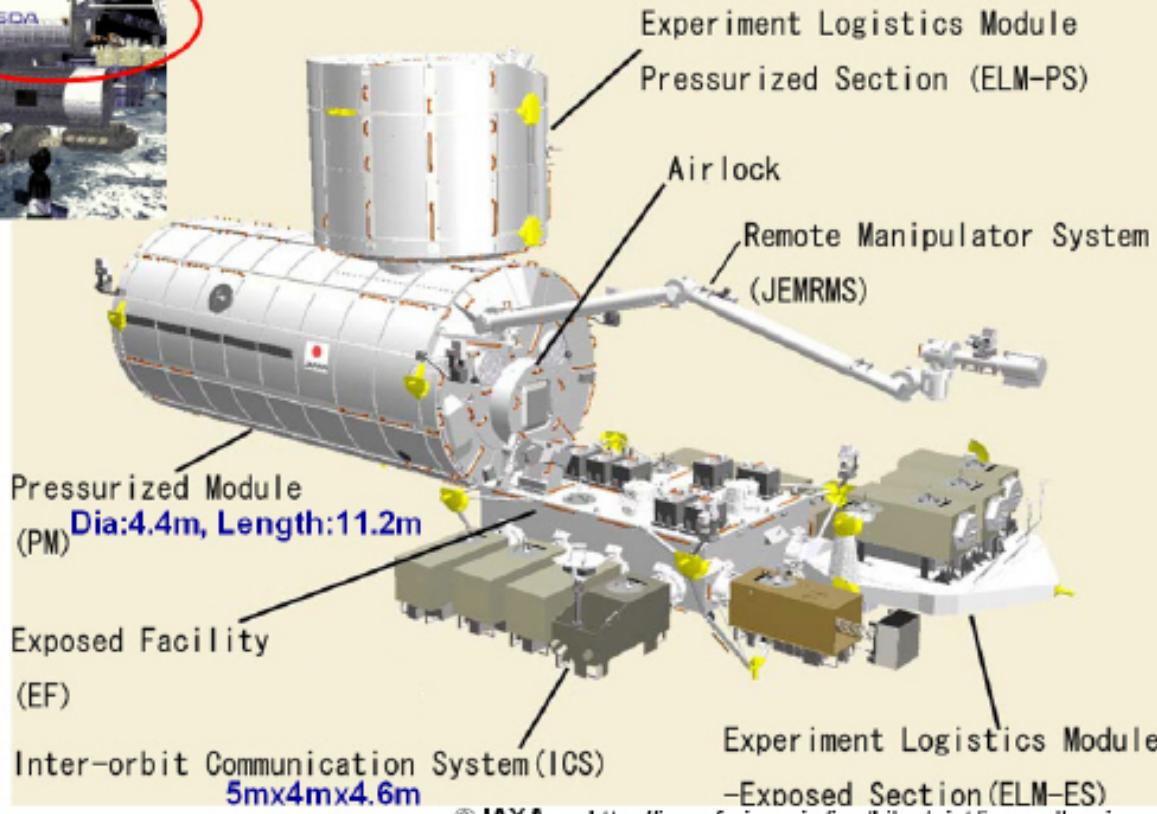

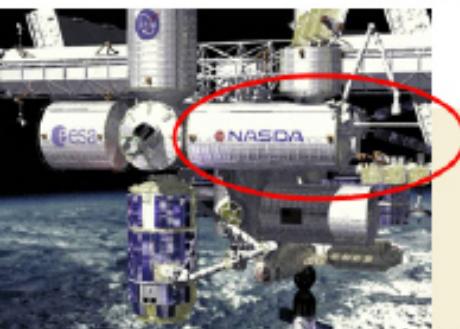

Figure 1. (a) Map of ~25,000 NLDN stroke locations that are accompanied by closely coincident FORTE VHF events. The stroke type is marked in color: green is -CG, blue is +CG, red is IC, and black is uncharacterized type (due to the nearest participating NLDN station being >625 km from the stroke). (b) Similar, but for the ~2400 FORTE VHF events meeting the automatic selection criteria to qualify as extremely narrow pulses.

Tatiana UV Flash

- 雷雲と関係あると考えるのがもっともらしい
- 落雷との時間相関なし
- 雲-雲放電?
 - たくさんの小さな放電の寄与か

Specification

Item	Value	Reference
Wavelength	330 – 400 nm	
Spatial res.	800m x 800m	Same as JEM-EUSO detector
Detector	MAPMTs	
Resolution	8 bit	
Cloud top altitude determination res.	~ 1 km	IFOV of 1-pixel
Exposure gate time	50 μ sec	= 20GTU
Time interval	3.5 sec	ISS travel time of 1-PDM FOV
Data rate	35 kbps	

- Photon counting of background photons
- Continuous measurements with the ISSmotion
→ Apply the “stereoscopic vision” method

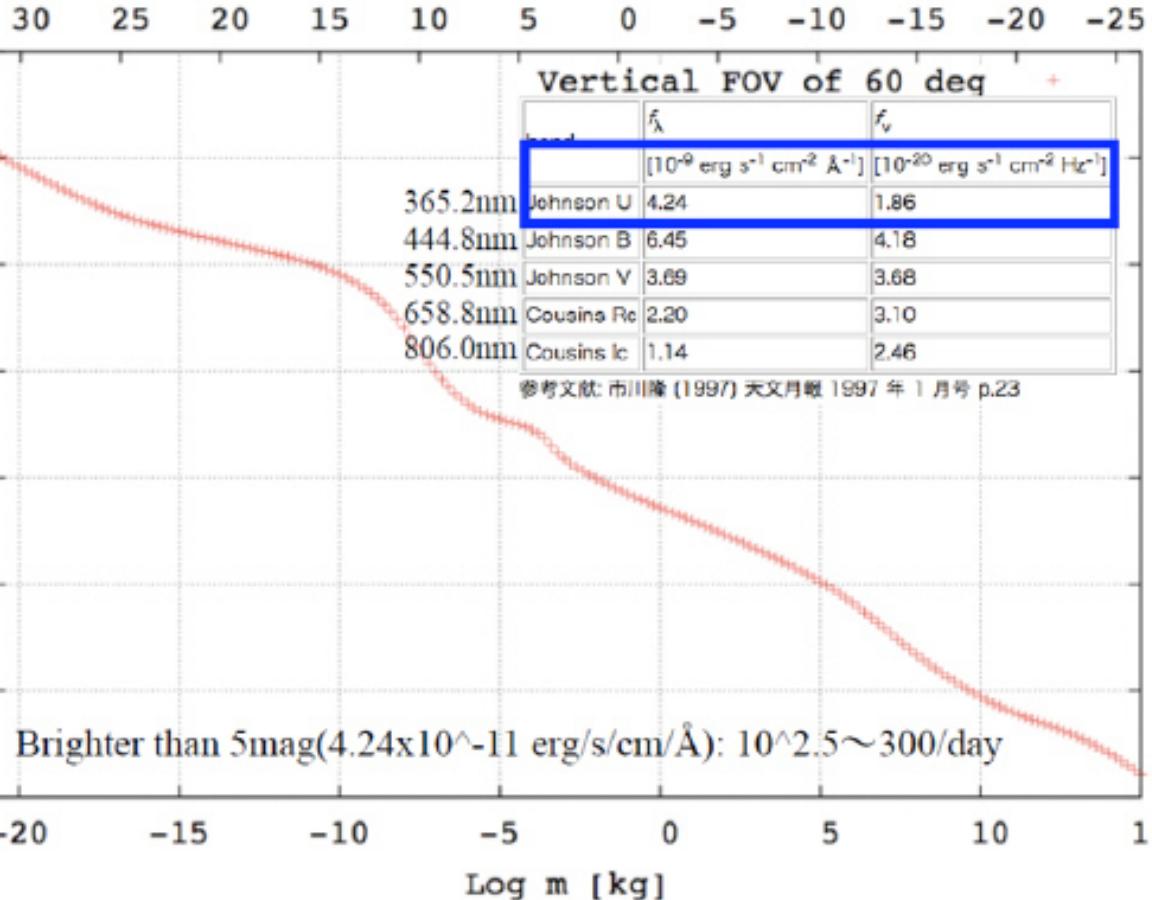

- Background photons
 $I = 500 \text{ (ph/m}^2\text{/str/ns)}$
- Detected photoelectrons
 $N_{p.e.} = 1 \text{ (p.e./pix/GTU)}$
- Expected slow-data counts
 $N_{p.e.} = 50 \text{ (p.e./pix/50 }\mu\text{s)}$

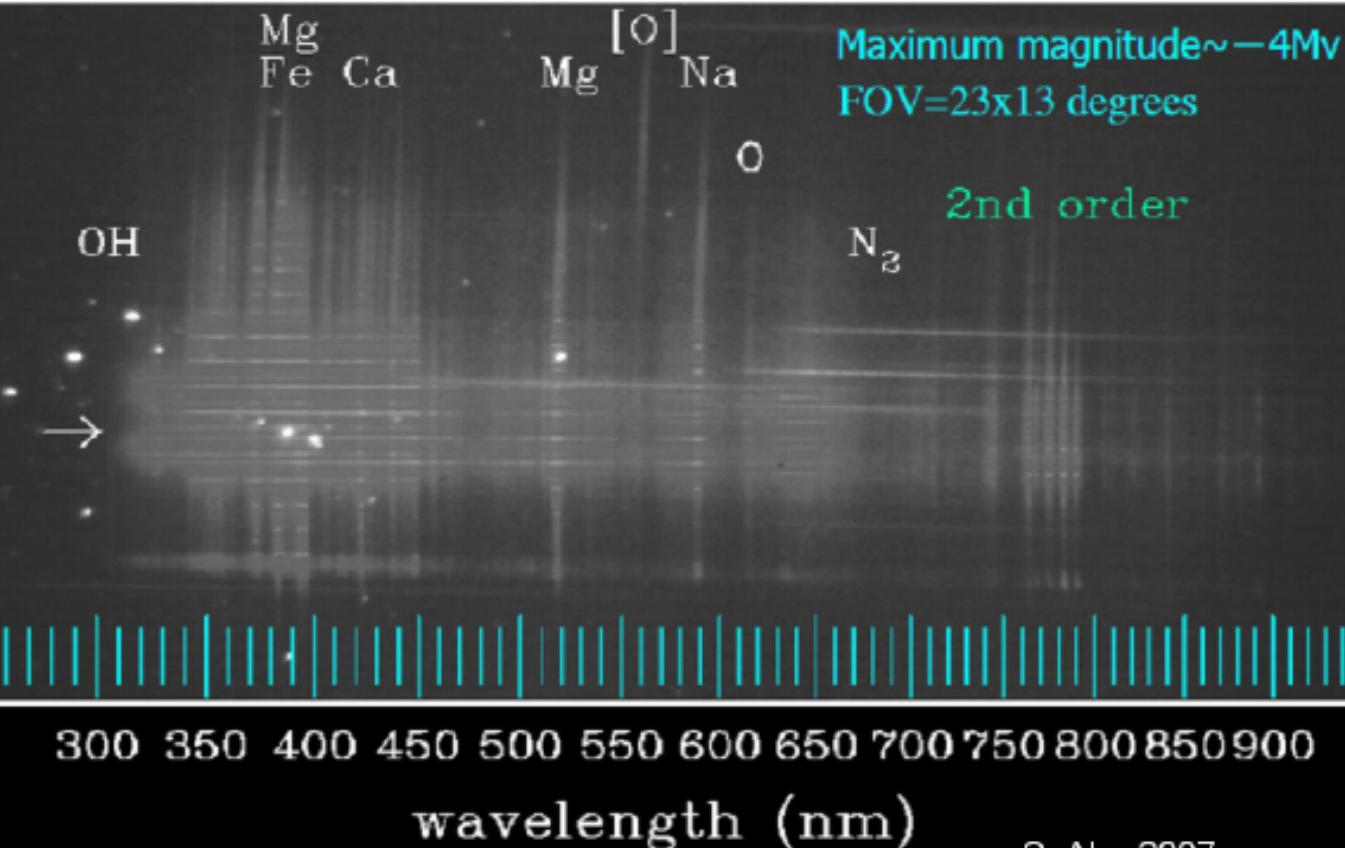

Cloud top altitude: $\Delta h \approx 1 \text{ km}$

Magnitude from ISS

Log N [Cumulative number / Earth / Day]

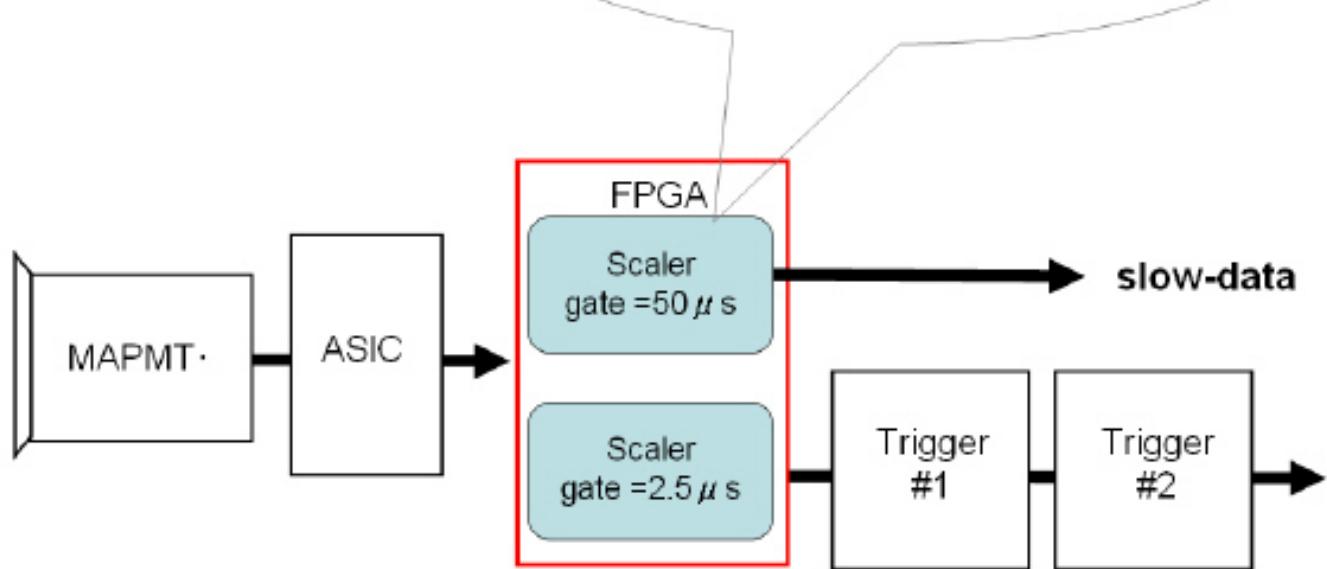

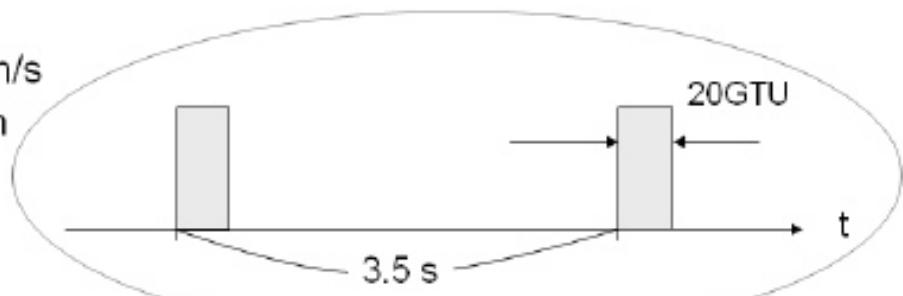

HDTV Spectrum of 2001 Leonid Meteor

Slow Data

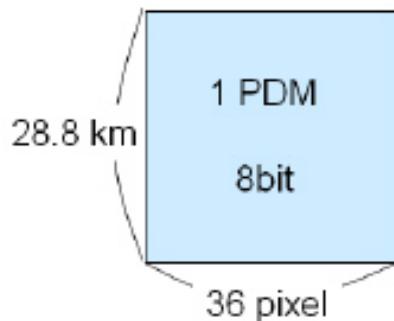

- 雲頂高度
 - ステレオ測定
- 流星
 - 10等～13等(トリガによる)
 - $1 \sim 10^5 /day$
 - 散在流星数の季節変化
 - 流星群観測(入射角、速度が一定)
- 夜光
- Tatiana UV Flash

- Velocity of ISS: 7.9 km/s
- FOV of 1PDM: 28.8 km

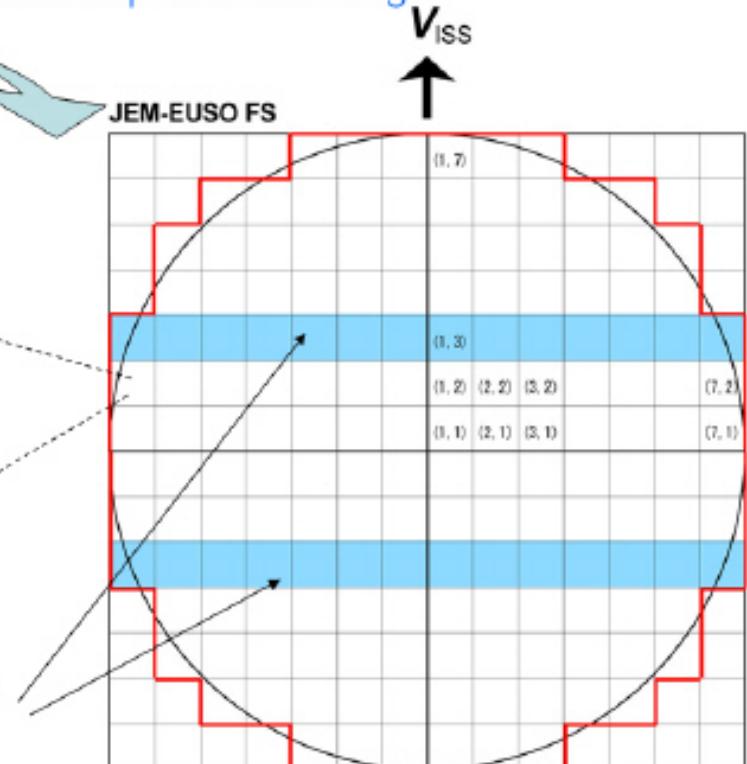

- All of PDMs equip "slow-data" DAQ
- Continuous BG photon counting

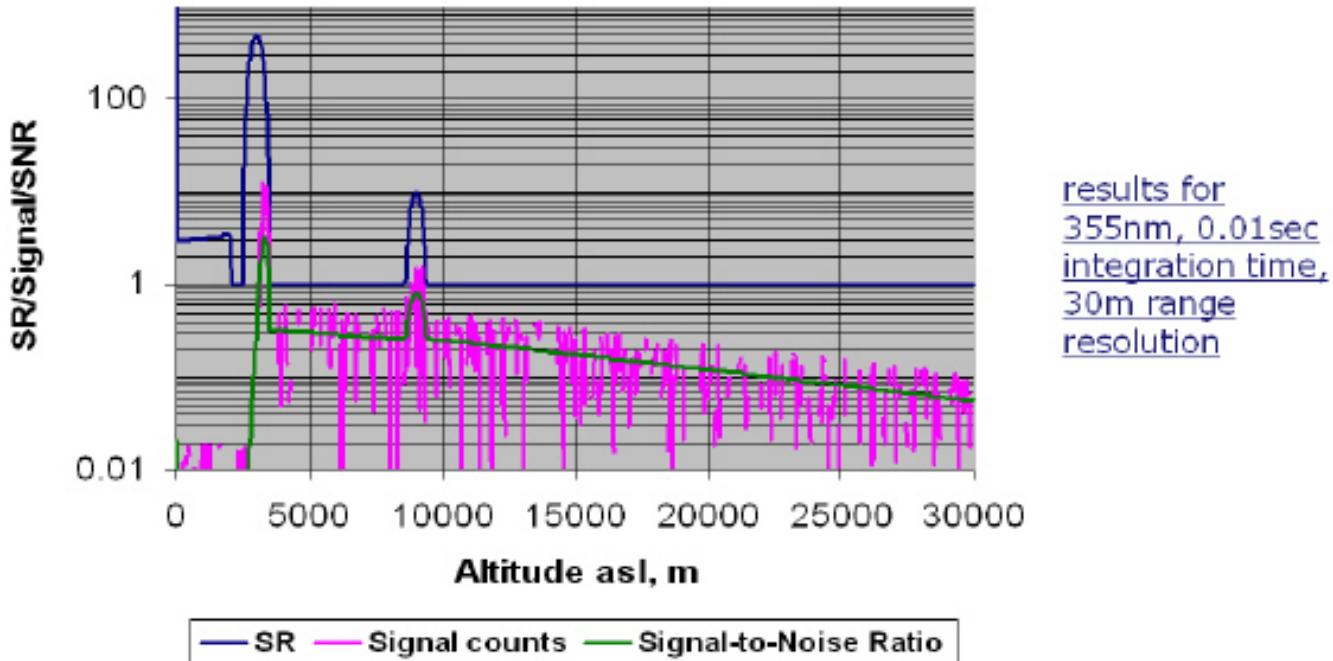

Slow-data obtained at only 2
PDM lines will be stored!

IR Camera Development with EADS/SODERN

Major Change from CIM01 to JEM-EUSO IR Camera

(1) Pixel size of detector

" 64×64 " → " 320×240 "

Boeing U3000A (320x240)

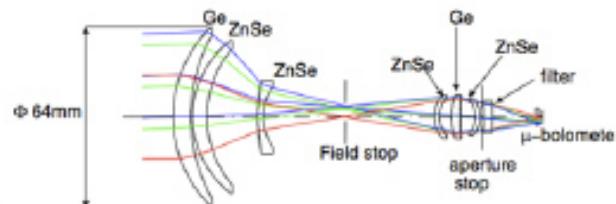

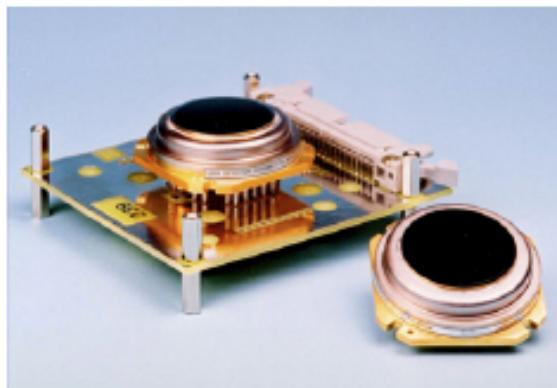

(2) FOV

Line scanning → $>60^\circ$

Based on CIM01 design, they can produce FM of JEM-EUSO IR camera with 5.5MEuro within 5 years.

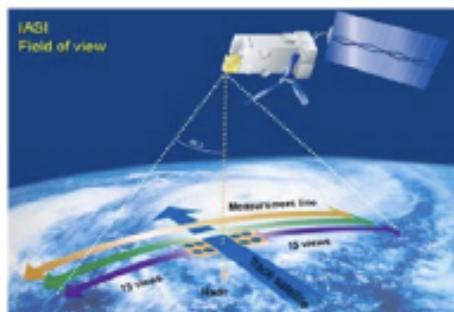

Specification of IR Camera

Should be determined before 12E, 2007

IR Camera Development with EADS/SODERN

CIM01 (or IASI) onboard METOP1 satellite

IASA Specification

- Scanning Mirror
- Sensor (CIM01)

$\lambda :$ 10.3 - 12.5

μm

sensor: bolometer array

pix. size: 64×64

res.: 12 bit

FOV: $60 \times 60 \text{ mrad}$

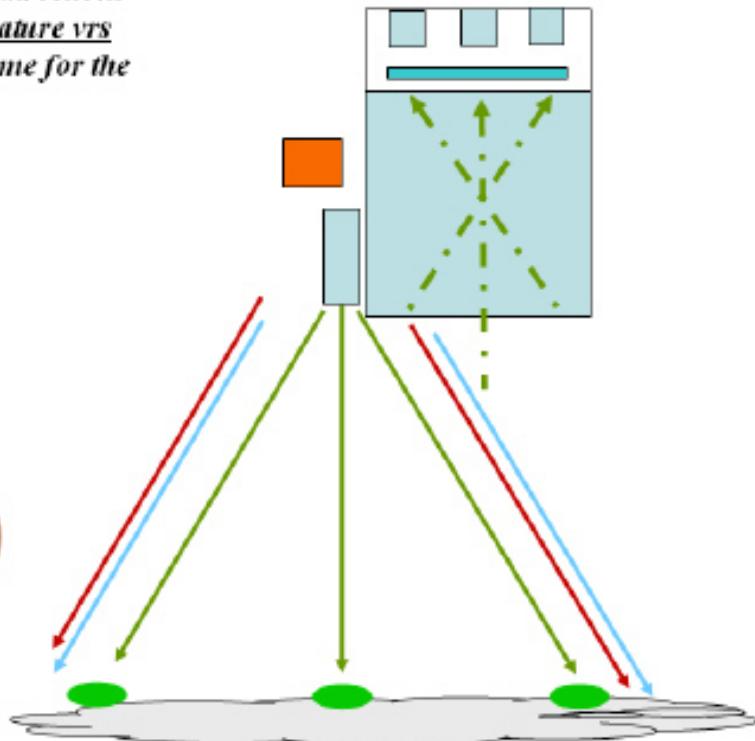

NETD : $<80 \text{ mK}$

Requirement

Item	Value	Reason
Wavelength	10 – 13 μm	Atmospheric transmission, S/N
FOV	> 60°	Same FOV as JEM-EUSO
Spatial Resolution	0.25°	1.8 km/pix @ nadir
Observation Temperature Range	200 – 320 K	Cloudtop temperature in troposphere
Absolute Temperature Resolution	< 3 K	Altitude resolution < 500m
IR Sensor	Uncooled Microbolometer Array	Mass, Power
Exposure Time	133 msec	ISS motion within $\frac{1}{2}$ - pix of IR camera
Observation Interval	30 sec (5 sec TBC)	ISS motion of JEM-EUSO $\frac{1}{2}$ FOV

IR Camera

*Using the measurements in these three-four directions
for calibration of the IR radiometer temperature vts
cloud top altitude – Reference lines ; the same for the
UV « slow mode »*

JEM-EUSO vs ESA-EUSO optics

日本実験棟「きぼう」

これからの予定

- 2007年度－2008年度(準備研究・概念設計)
 - 2007年10月 曝露部分科会へ報告
 - 2007年11月 国際JEM-EUSO会合
 - 2008年1月 国際アドバイザリボード会合
 - 2008年3月 国際シンポジウム開催
 - 2008年4月 中間評価
 - 2009年3月 最終評価
- 2009年度－2012年度
 - 製作段階
- 2013年 打ち上げ

これまでの経緯

- **ESA-EUSO**
 - ESA 採択 2000;
 - NASA 採択 2003;
 - Phase-A 完了 2004
 - 地上公募研究: 1998 - 2001 2002 - 2004
- **2006年6月:**
 - JEM-EUSO WGが宇宙理学委員会において承認ISAS/JAXA
- **2006年8月:**
 - JEM-EUSO計画化委員会が理研中央研究所に設置
- **2006年11月:**
 - 第二期利用ミッション候補公募開始
- **2007年2月:**
 - 理研から提案書提出
- **2007年5月:**
 - 採択の正式通知
- **2007年6月**
 - Kick-Off会合
 - 国際アドバイザリボード会合
- **2007年7月**
 - 第一回国際JEM-EUSO会合(国際宇宙線会議@メキシコ)

ミッション諸元

- 打ち上げ時期: year 2013
- 運用期間: 3 years (+ 2 years)
- 打ち上げロケット: H2B
- ISSへの運搬: HTV非与圧キャリア
- 装着場所: JEM EFU#2
- 軌道高度: ~430km
- 軌道傾斜角: 51.6°
- 質量: 1896 kg
- 使用電力: 998 W (operative),
344 W (non-operative)
- データ転送量: 297 kpbs

サクセスクライテリア

フルサクセス:

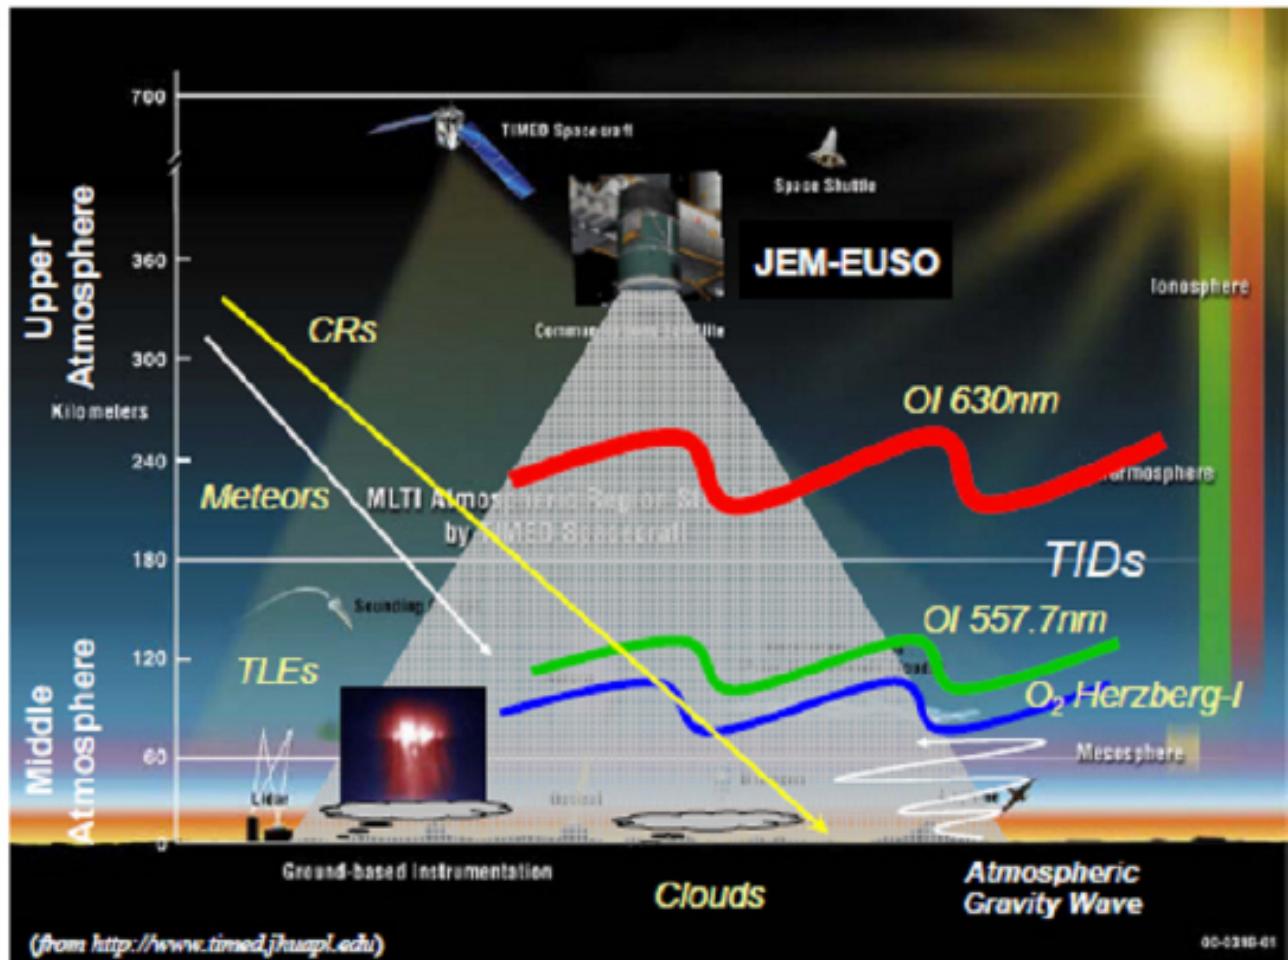

極限エネルギー事例: 1000個以上
(7×10^{19} eV 以上)

ミニマムサクセス:

フルサクセスの半分の事例数を得る: 500個

分布から起源を議論の余地なく特定できる臨界量

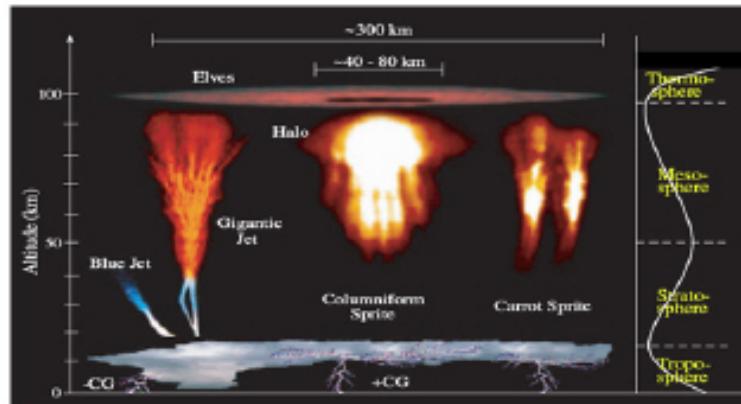

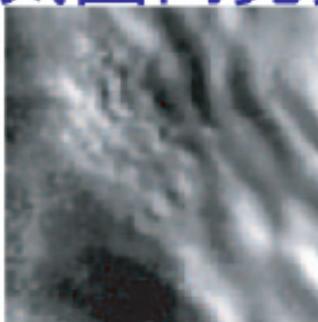

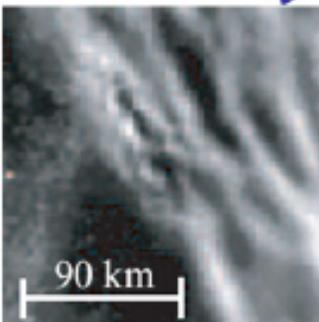

- 粒子到来方向解析
 - 到来方向決定精度: 2.5度以下
- スペクトル解析
 - エネルギー決定精度: 30%以下
- ハドロン／光子／ニュートリノの識別:
 - シャワー最大深さ決定精度: 120 g/cm²以下

■ *The real atmosphere – clouds and desert dust*

Sahara dust over the Atlantic on 26.2.2000

Atmospheric Monitoring System

- **IR Camera**

Imaging observation of cloud temperature
inside FOV of JEM-EUSO

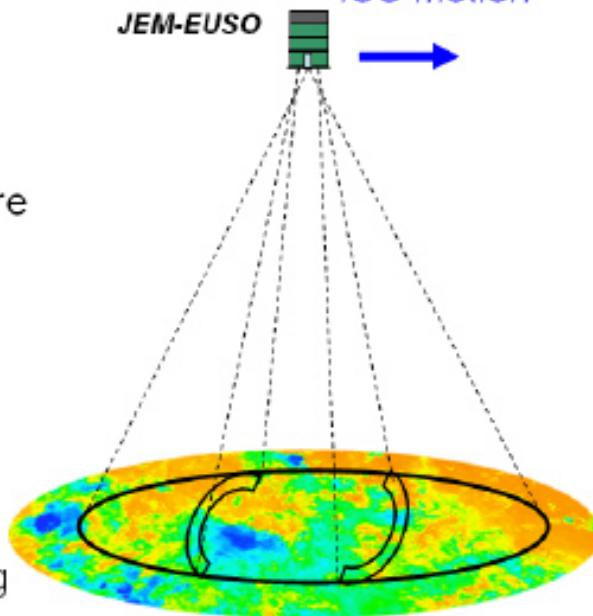

- **Lidar**

Ranging observation using UV laser

- **JEM-EUSO “slow-data”**

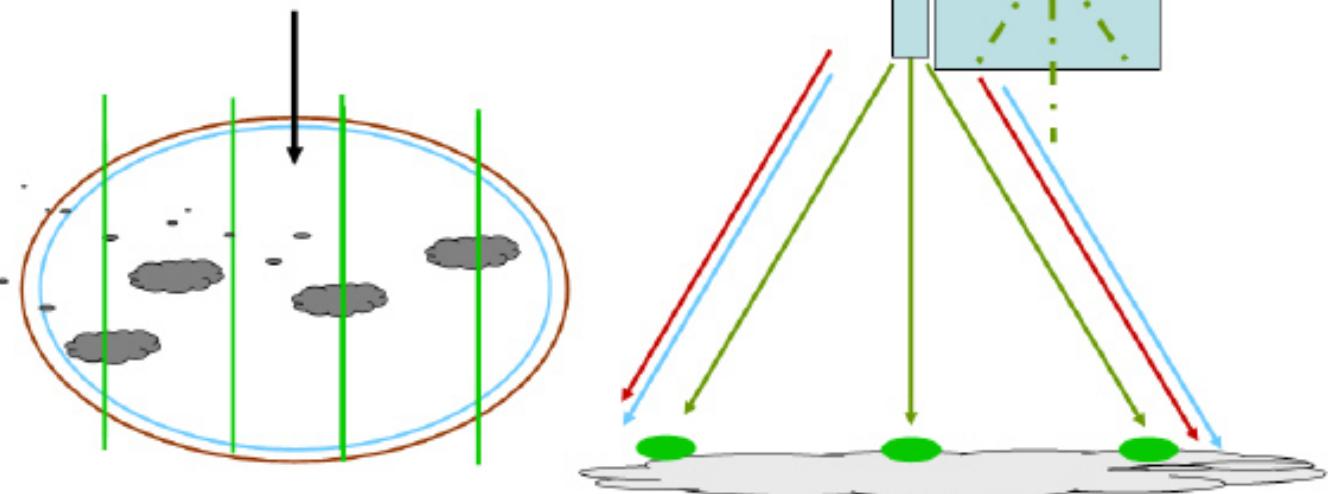

Continuous background photon counting

JEM-EUSO ISS motion →

- *Cloud amount, cloud top altitude:* (IR cam., Lidar, slow-data)
- *Airglow:* (slow-data)
- *Calibration of telescope:* (Lidar)

*Using the measurements in these three-four directions
for calibration of the IR radiometer temperature vts
cloud top altitude – Reference lines ; the same for the
UV « slow mode »*

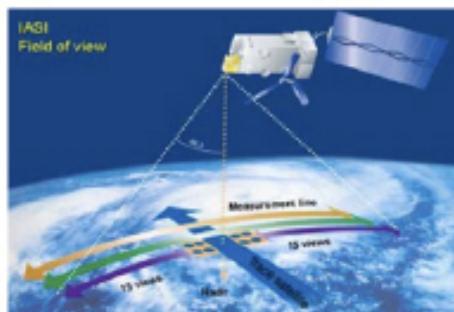

IR Camera

Requirement

Item	Value	Reason
Wavelength	10 – 13 μm	Atmospheric transmission, S/N
FOV	> 60°	Same FOV as JEM-EUSO
Spatial Resolution	0.25°	1.8 km/pix @ nadir
Observation Temperature Range	200 – 320 K	Cloudtop temperature in troposphere
Absolute Temperature Resolution	< 3 K	Altitude resolution < 500m
IR Sensor	Uncooled Microbolometer Array	Mass, Power
Exposure Time	133 msec	ISS motion within $\frac{1}{2}$ - pix of IR camera
Observation Interval	30 sec (5 sec TBC)	ISS motion of JEM-EUSO $\frac{1}{2}$ FOV

IR Camera Development with EADS/SODERN

CIM01 (or IASI) onboard METOP1 satellite

IASA Specification

- Scanning Mirror
- Sensor (CIM01)

$\lambda :$ 10.3 - 12.5

μm

sensor: bolometer array

pix. size: 64×64

res.: 12 bit

FOV: $60 \times 60 \text{ mrad}$

NETD : $<80 \text{ mK}$

IR Camera Development with EADS/SODERN

Major Change from CIM01 to JEM-EUSO IR Camera

(1) Pixel size of detector

" 64×64 " → " 320×240 "

Boeing U3000A (320x240)

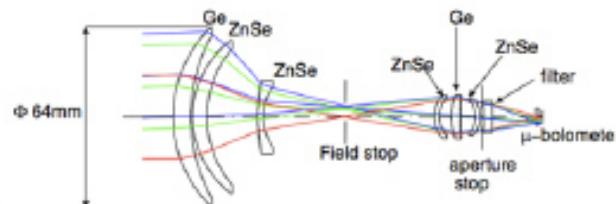

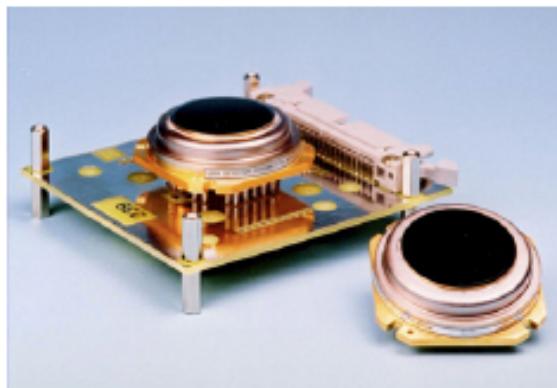

(2) FOV

Line scanning → $>60^\circ$

Based on CIM01 design, they can produce FM of JEM-EUSO IR camera with 5.5MEuro within 5 years.

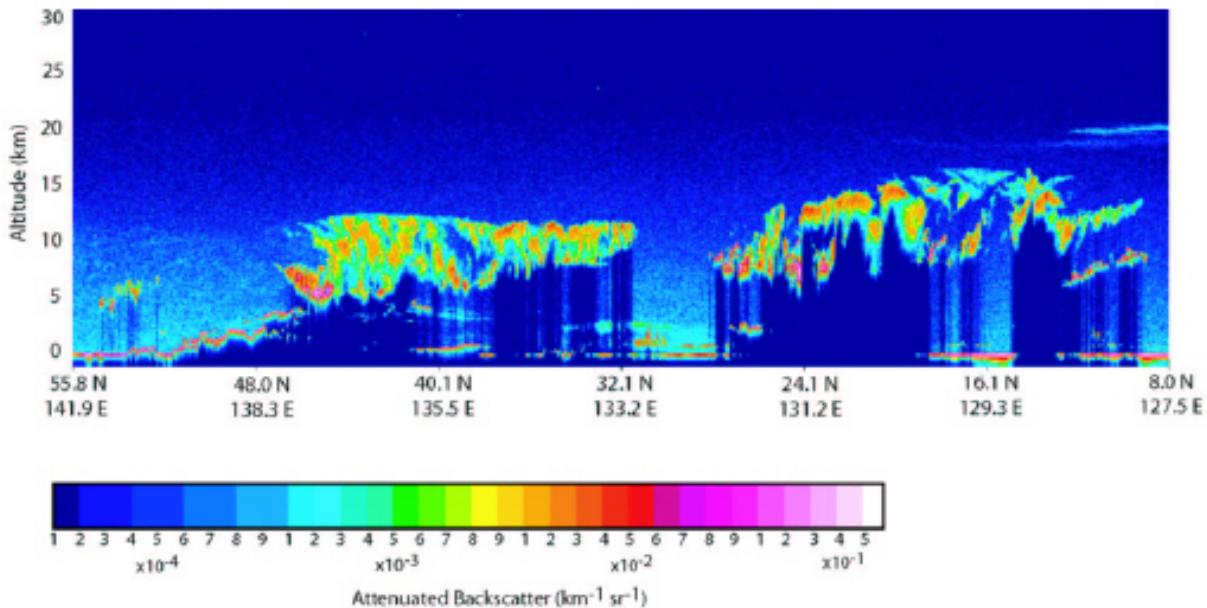

Specification of IR Camera

Should be determined before 12E, 2007

Lidar

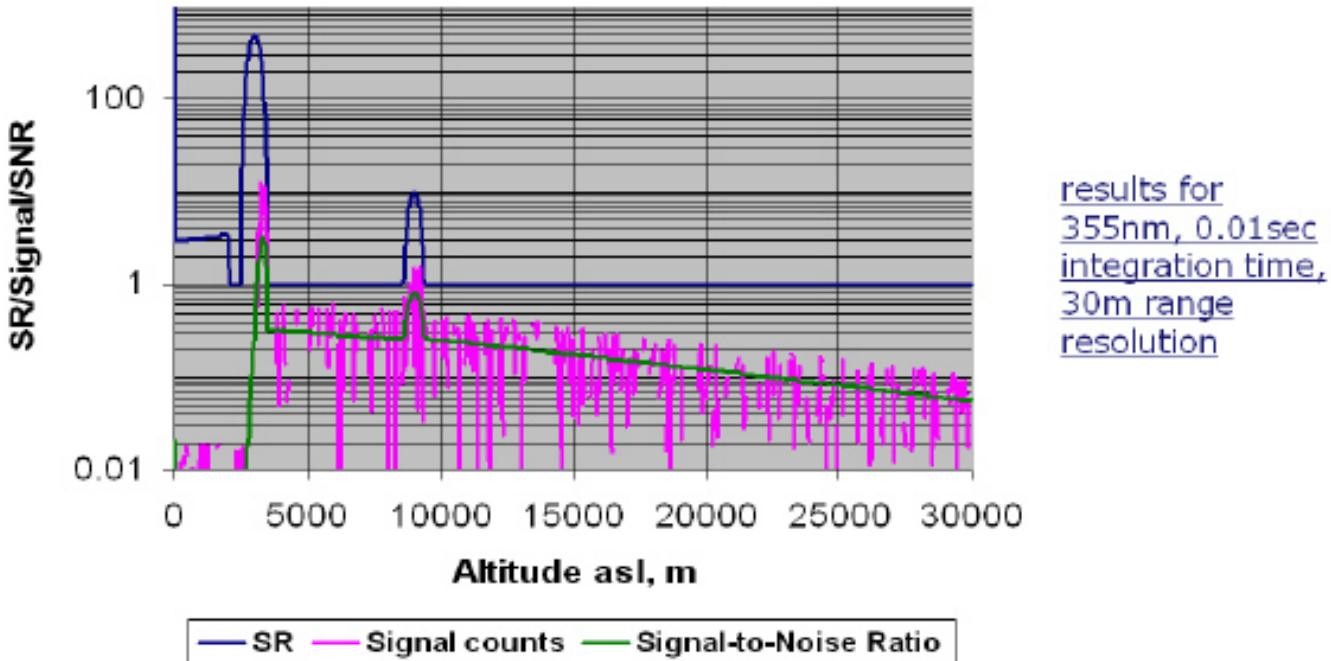

Another spaceborne lidar- first CALIPSO results (#2)

Performance simulations, #1: Subsystems

Subsystem		Lidar 1	Lidar 2
Transmitter	Wavelength, nm	355	532
	Pulse repetition rate, pps	100	100
	Averaged transmitted power, W	1	1
	Divergence full angle , mrad	0.08	0.08
	Optical efficiency	80	80
Receiver	Primary receiver aperture diam, cm	250	250
	Secondary mirror aperture, cm	0	0
	Field of View full angle, mrad	0.2	0.2
	Interference filter, FWHM	0.25	0.25
	Interference filter, transmission %	50	50
	Optical efficiency (without filter)	25	25
Detector	Quantum efficiency, %	25	15
	Dark noise, counts per second	500	600
Acquisition (ph. counting)	Range resolution, bin meters	30	30
	Integration time, sec	0.01/1	0.01/1
Satellite	Altitude, km	500	500

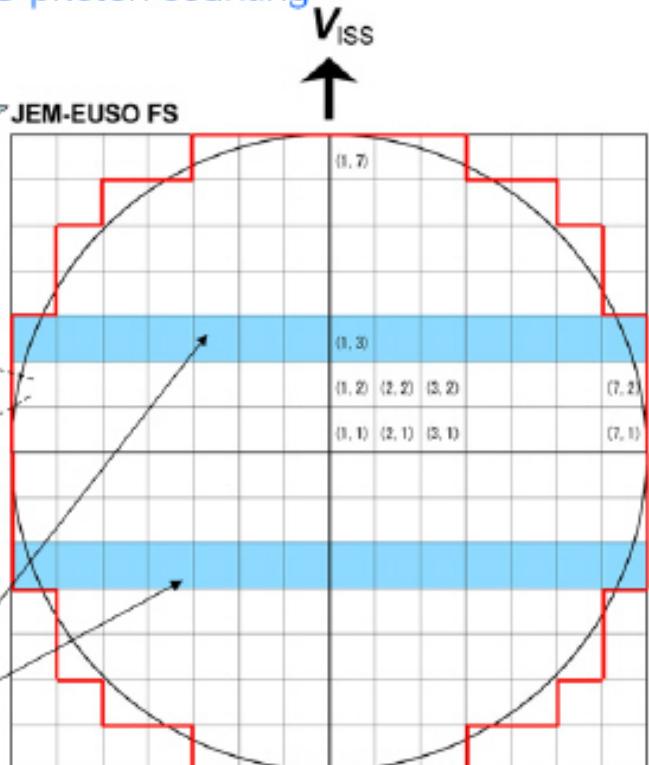

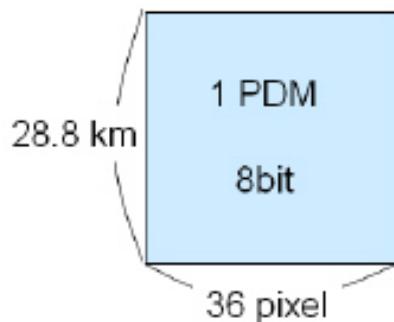

Performance simulations, #3:

Slow-Data

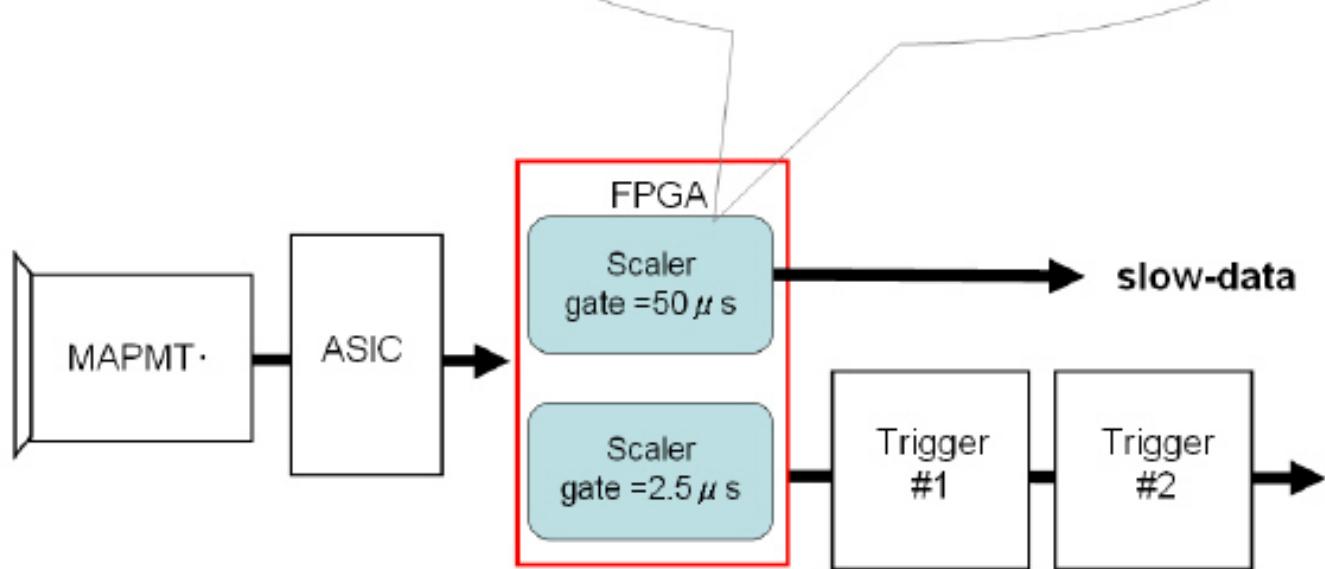

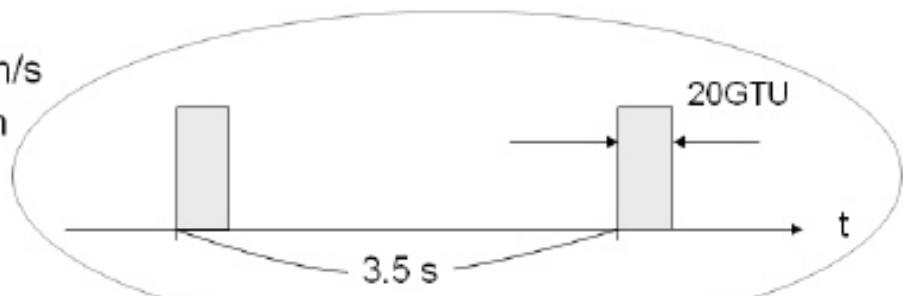

- All of PDMs equip "slow-data" DAQ
- Continuous BG photon counting

Slow-data obtained at only 2
PDM lines will be stored!

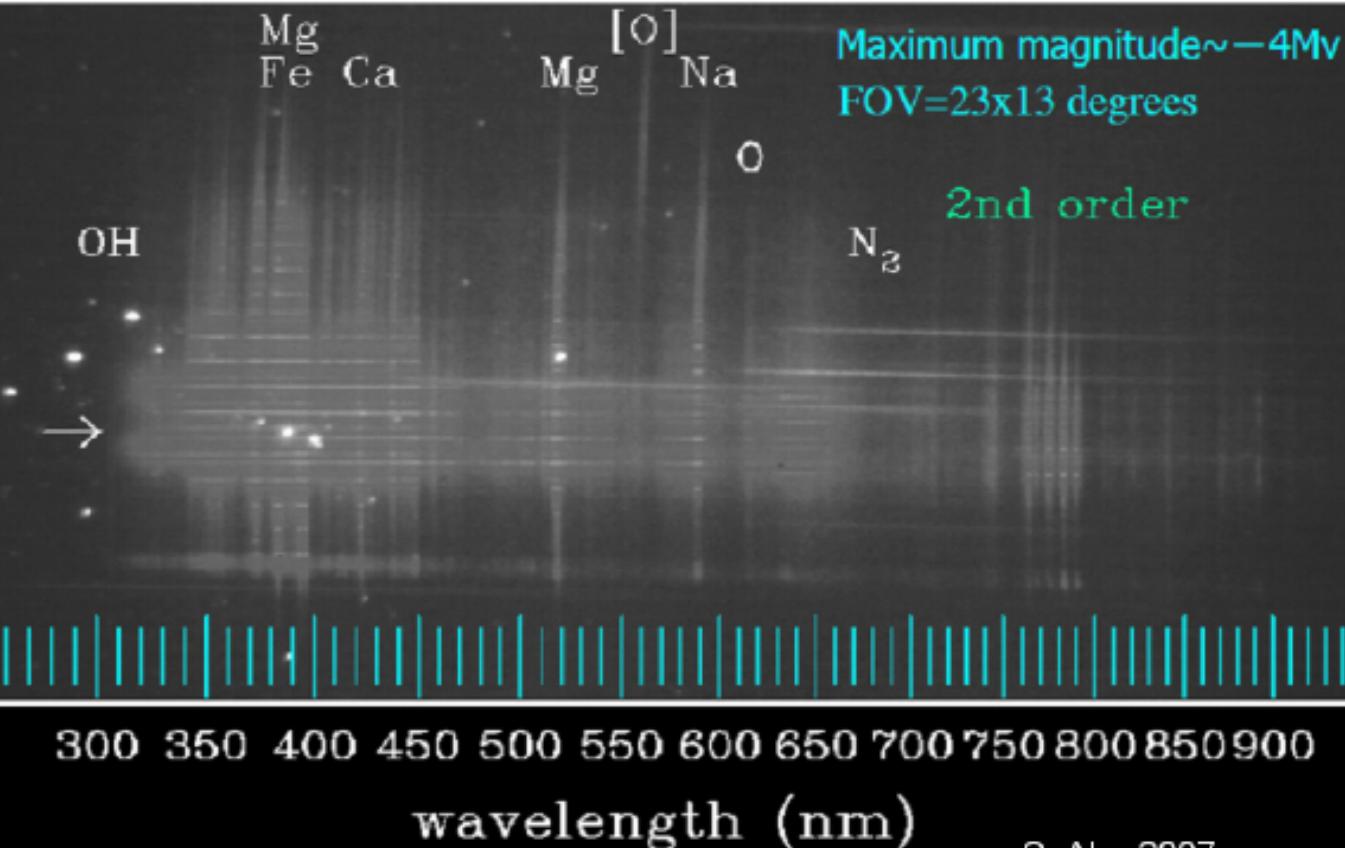

- Velocity of ISS: 7.9 km/s
- FOV of 1PDM: 28.8 km

Slow Data

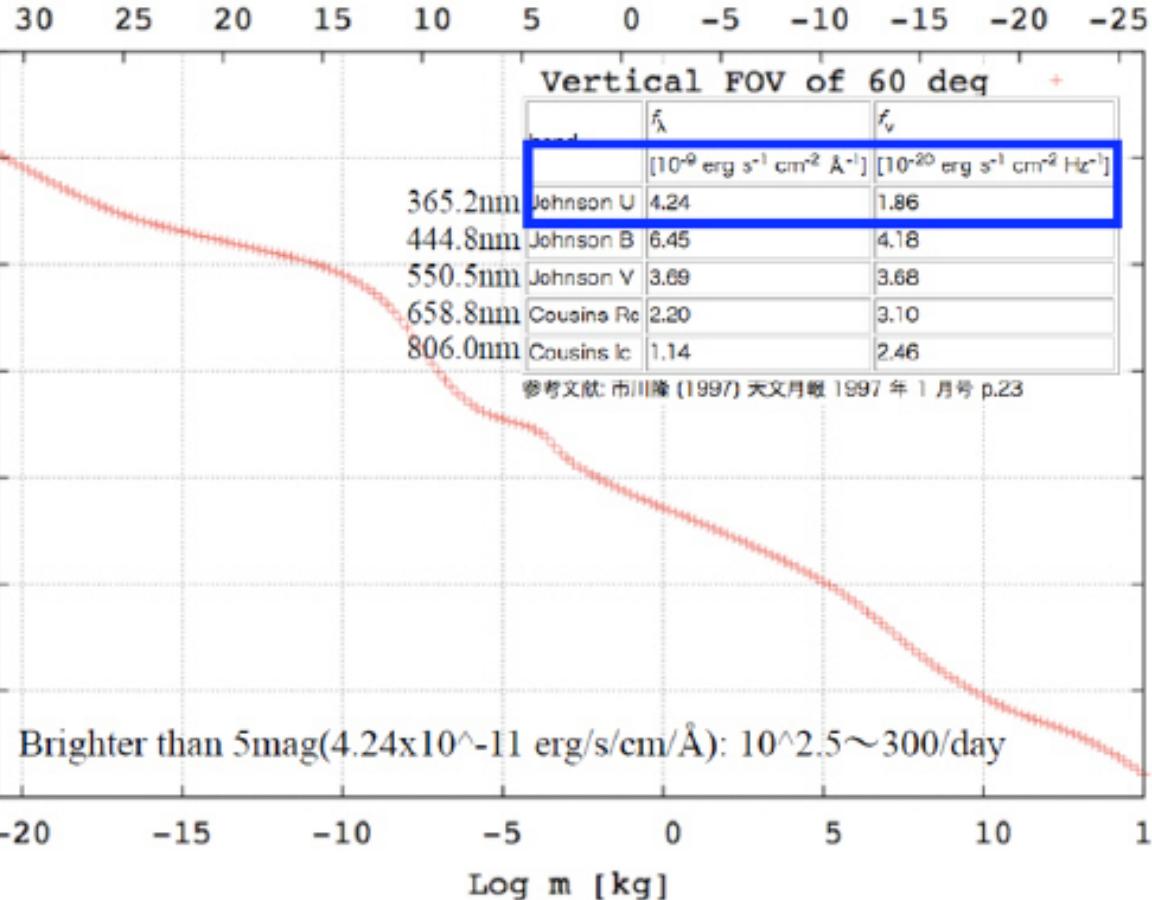

- 雲頂高度
 - ステレオ測定
- 流星
 - 10等～13等(トリガによる)
 - $1 \sim 10^5 /day$
 - 散在流星数の季節変化
 - 流星群観測(入射角、速度が一定)
- 夜光
- Tatiana UV Flash

HDTV Spectrum of 2001 Leonid Meteor

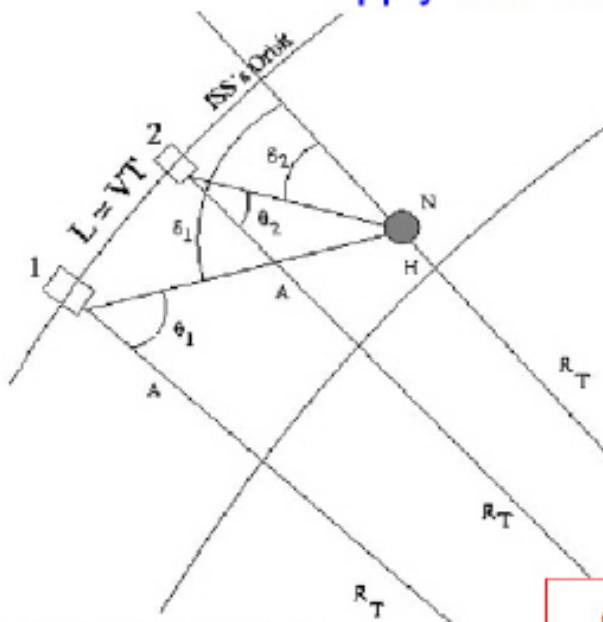

Magnitude from ISS

Log N [Cumulative number / Earth / Day]

- Photon counting of background photons
- Continuous measurements with the ISSmotion
→ Apply the “stereoscopic vision” method

- Background photons
 $I = 500 \text{ (ph/m}^2\text{/str/ns)}$
- Detected photoelectrons
 $N_{p.e.} = 1 \text{ (p.e./pix/GTU)}$
- Expected slow-data counts
 $N_{p.e.} = 50 \text{ (p.e./pix/50 }\mu\text{s)}$

Cloud top altitude: $\Delta h \approx 1 \text{ km}$

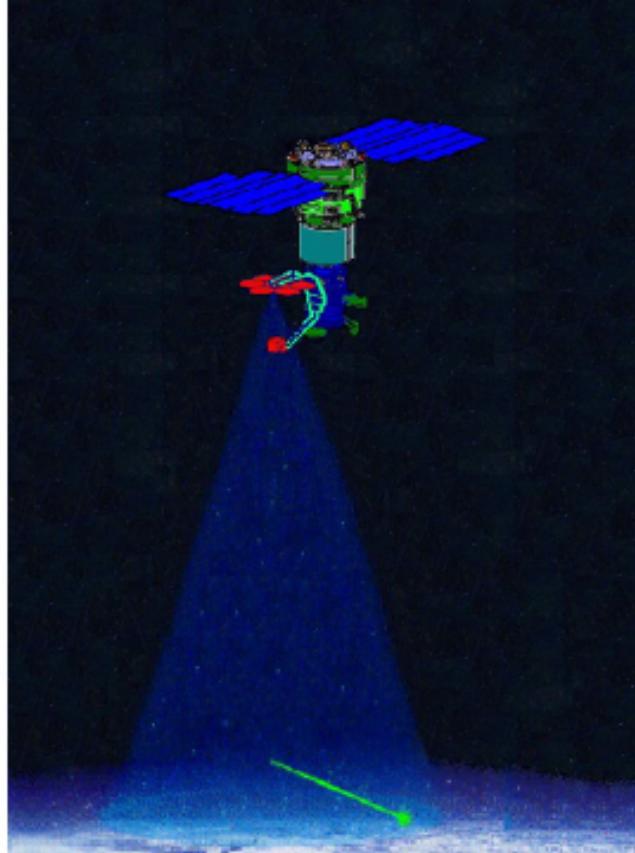

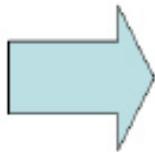

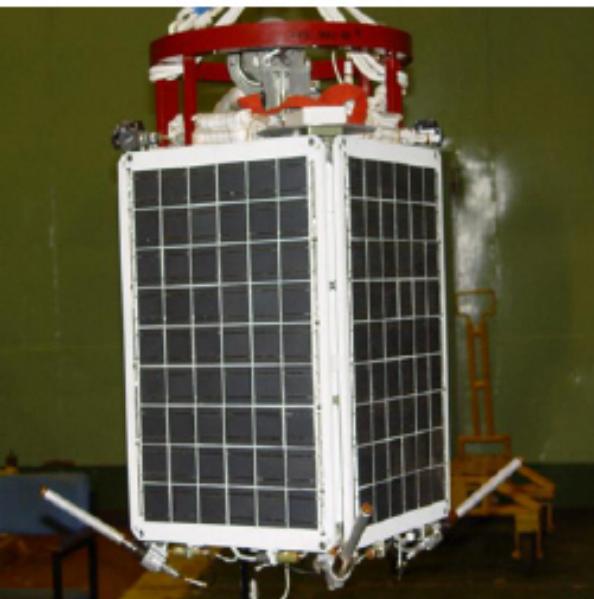

Specification

Item	Value	Reference
Wavelength	330 – 400 nm	
Spatial res.	800m x 800m	Same as JEM-EUSO detector
Detector	MAPMTs	
Resolution	8 bit	
Cloud top altitude determination res.	~ 1 km	IFOV of 1-pixel
Exposure gate time	50 μ sec	= 20GTU
Time interval	3.5 sec	ISS travel time of 1-PDM FOV
Data rate	35 kbps	

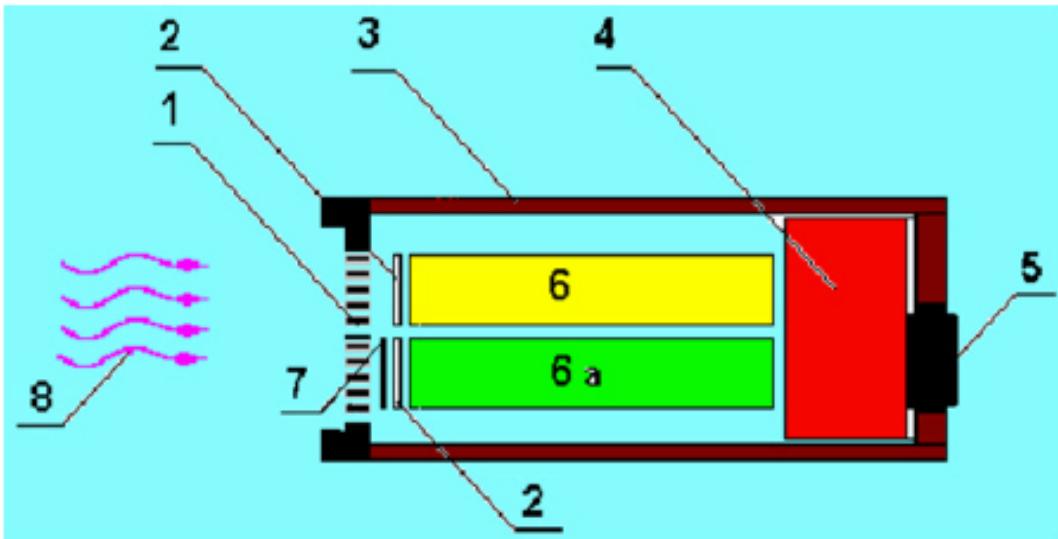

Tatiana UV Flash

- 雷雲と関係あると考えるのがもっともらしい
- 落雷との時間相関なし
- 雲-雲放電?
 - たくさんの小さな放電の寄与か

The results of satellite “Tatiana” launched in January 2005 are important for planning TUS.

The detector of UV radiation

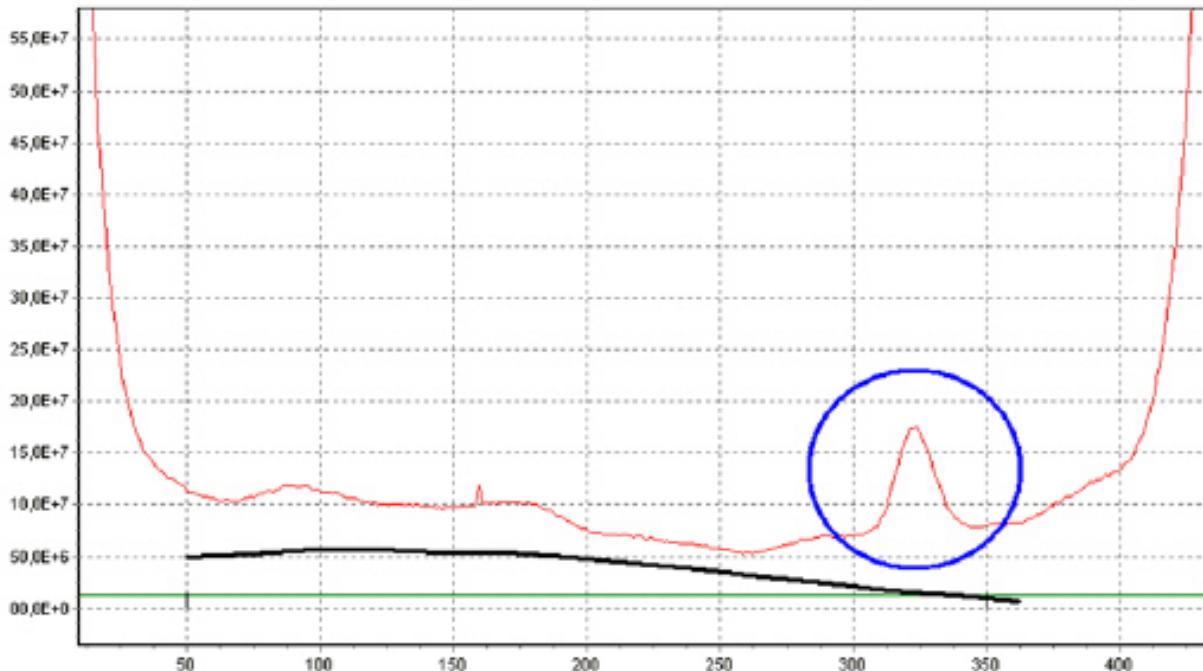

Some detector parameters:

FOV: 15°

$S = 0,4 \text{ c} \cdot \text{m}^{-2}$.

UV filter: 200 – 400 nm

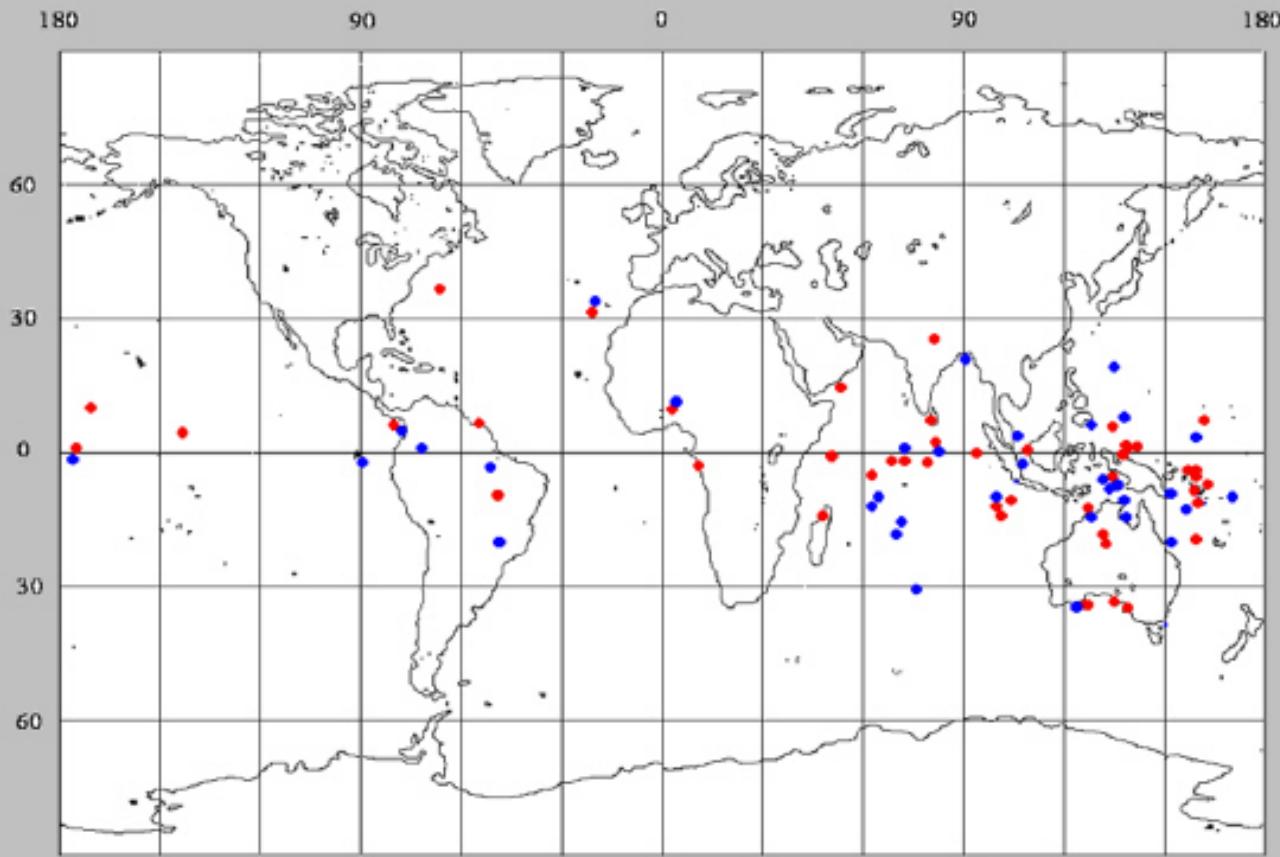

Examples of satellite “Tatiana” data

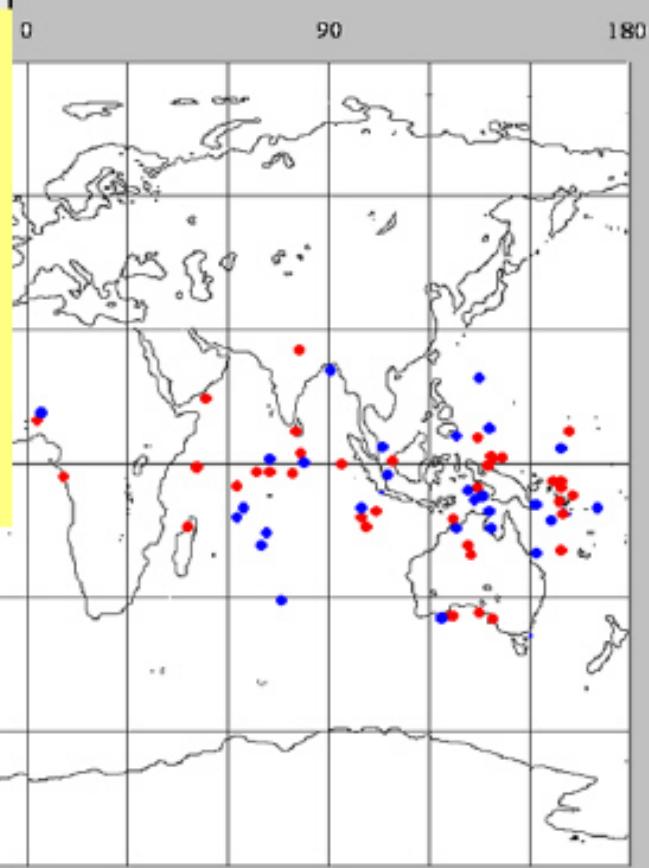

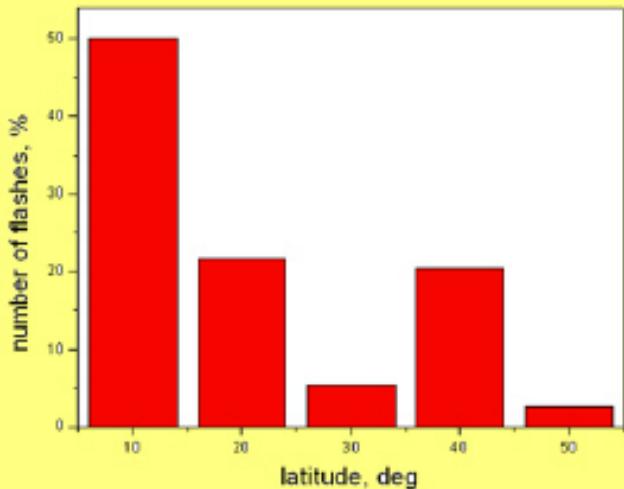

13.02.2005

Moon phase 25 %, Blue oval – the satellite is above Japan.

The geographical distribution of UV flashes

The geographical distribution of UV flashes

The geographical distribution of UV flashes

The geographical distribution of UV flashes

Narrow Bipolar Event

- FORTE衛星によるVHF観測
- 孤立した電波パルスイベント
 - 一般の雷のパルス列に先行
 - $T < 1 \mu s$
 - 10J-100J
- 可視光に対応する閃光パルスなし
- Runaway Electron Breakdown
 - Gurevich and Zybin 2004
 - 宇宙線空気シャワーがトリガ？
 - 電子が100–1000倍に増大
 - 近紫外で蛍光

NBEの伝播効果

NBEの空間分布

海上に多い？！

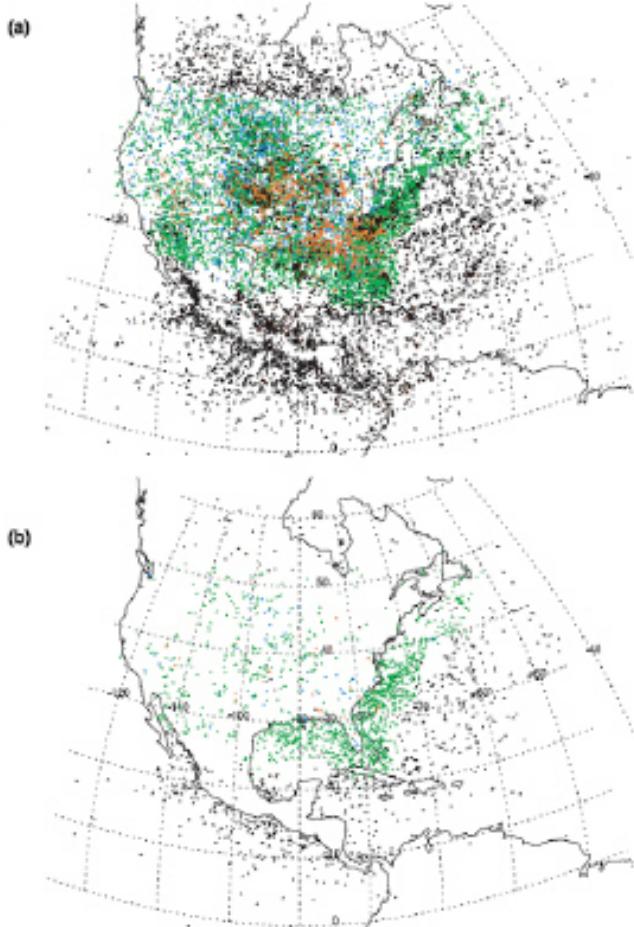

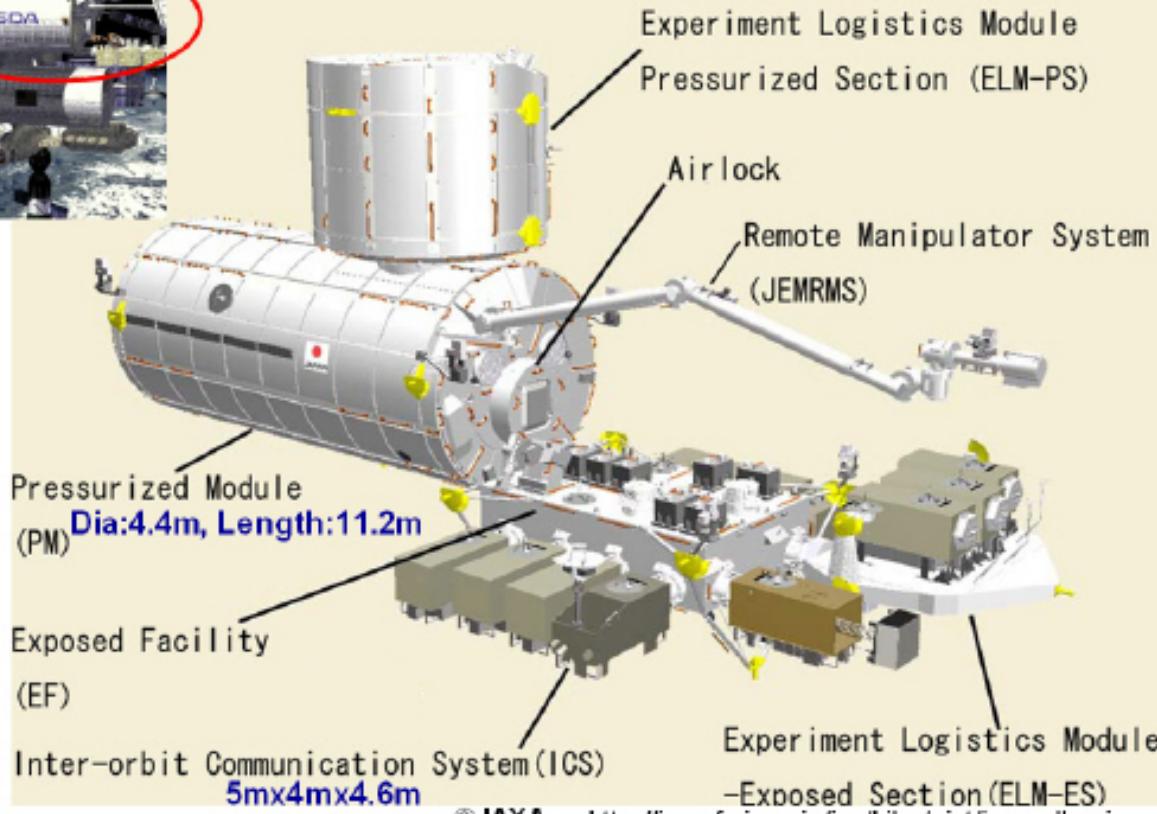

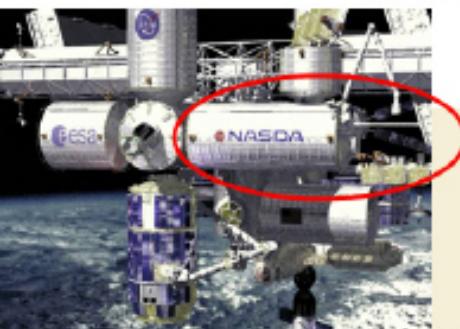

Figure 1. (a) Map of ~25,000 NLDN stroke locations that are accompanied by closely coincident FORTE VHF events. The stroke type is marked in color: green is -CG, blue is +CG, red is IC, and black is uncharacterized type (due to the nearest participating NLDN station being >625 km from the stroke). (b) Similar, but for the ~2400 FORTE VHF events meeting the automatic selection criteria to qualify as extremely narrow pulses.

日本実験棟「きぼう」

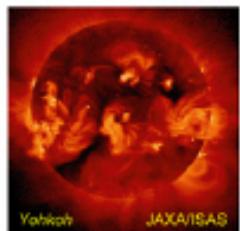

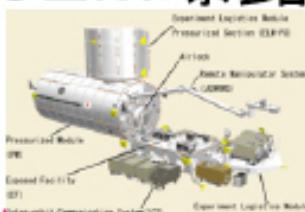

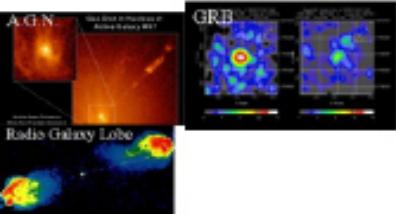

宇宙ステーションの再定義

- ・ 多波長同時地球観測プラットフォームとして再定義
 - 惑星間空間から対流圏を串刺しにして捉える
 - 安定した長期運用:少なくとも20年
 - 機動的な装置更新
- ・ 気候変動は対流圏だけの現象ではない
 - 宇宙線による大気電離度の変化→雲
 - 成層圏との相互作用
 - 全球電流回路
- ・ 地文台のコンセプトをもとにした科学の新領域
 - 共同して科研費:多くの分野にまたがった
 - 曝露部利用への追加提案の可能性
 - とりあえずの地上実験の企画

The positions of the 472 AGN (318 in the field of view of the Observatory) with redshift $z \leq 0.018$ ($D < 75$ Mpc) from the 12th edition of the catalog of quasars and active nuclei (12) are indicated by red asterisks. The solid line represents the border of the field of view (zenith angles smaller than 60°). Darker color indicates larger relative exposure. Each colored band has equal integrated exposure. The dashed line is the supergalactic plane. Centaurus A, one of our closest AGN, is marked in white.

Y-Time

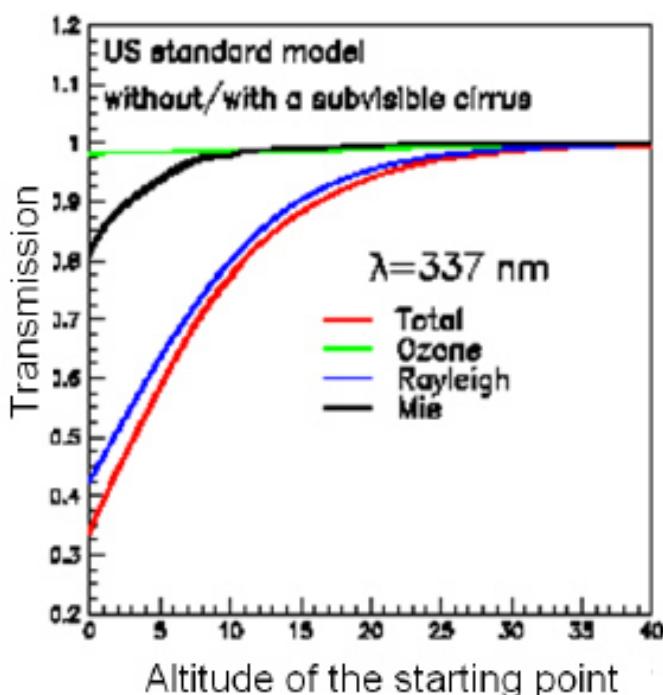

Light Curve (Photon)

宇宙から見る利点

- 上層大気は希薄で散乱が少ない
 - 地上からだと汚い下層大気の吸収をこうむる
 - 10km先だと10%以下
- 夜は雲頂高度が低い
 - ほとんどは<3km
 - 空気シャワーの大部分は雲の上で最大を迎える
- 距離が決まっている
 - 軌道高度(400km)>>大気厚さ(10km)

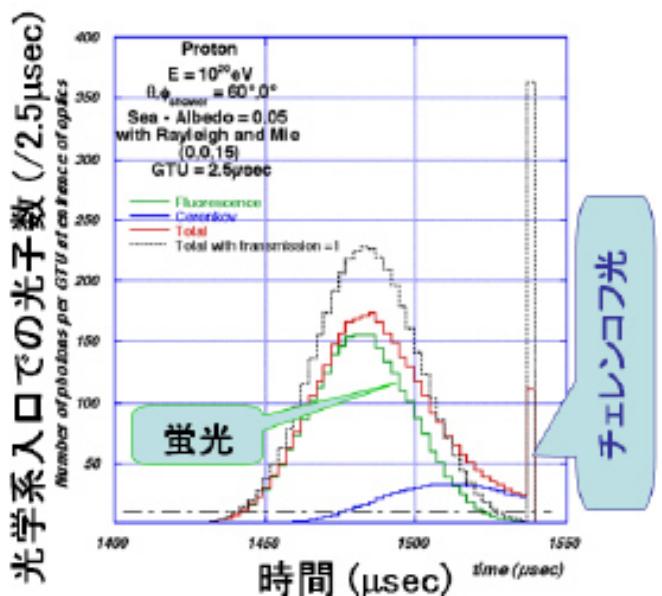

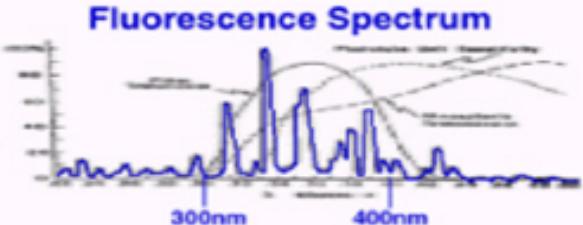

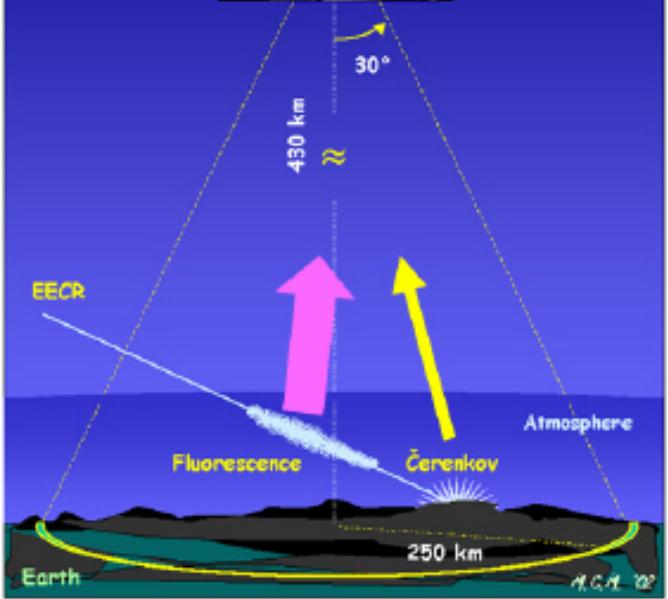

EUSOの観測方法

宇宙線が大気中に飛び込んで来て、空気シャワーをつくり、シャワー中の電子が窒素や窒素イオンを励起して蛍光を発する。

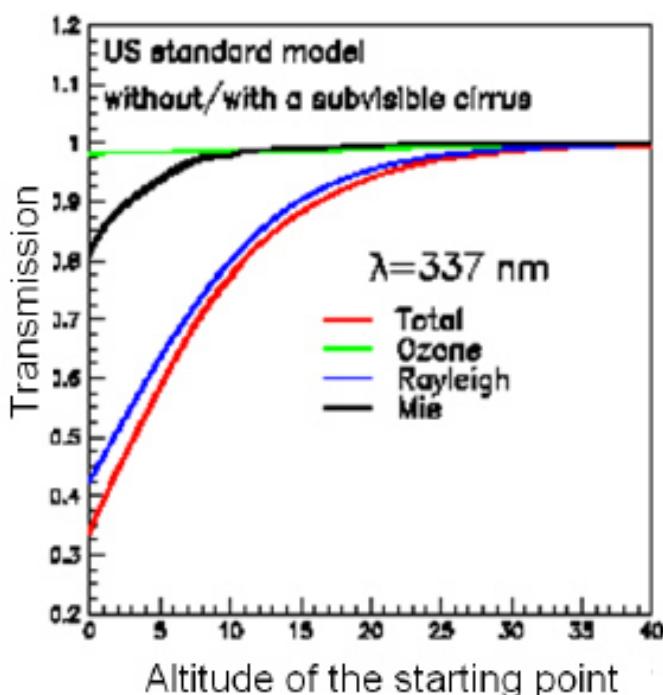

この蛍光を口径2.5mの望遠鏡で観測する。

空気シャワーにそって発せられたチエレンコフ光の地上や海上での反射光を観測する。

EUSOの観測方法

宇宙線が大気中に飛び込んで来て、空気シャワーをつくり、シャワー中の電子が窒素や窒素イオンを励起して蛍光を発する。

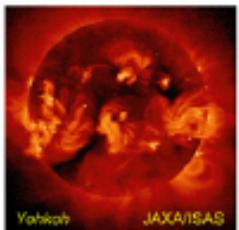

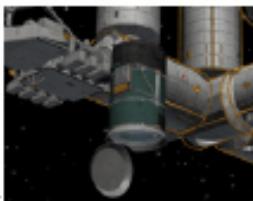

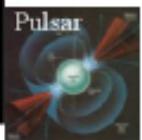

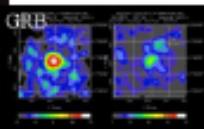

この蛍光を口径2.5mの望遠鏡で観測する。

空気シャワーにそって発せられたチエレンコフ光の地上や海上での反射光を観測する。

宇宙から見る利点

- 上層大気は希薄で散乱が少ない
 - 地上からだと汚い下層大気の吸収をこうむる
 - 10km先だと10%以下
- 夜は雲頂高度が低い
 - ほとんどは<3km
 - 空気シャワーの大部分は雲の上で最大を迎える
- 距離が決まっている
 - 軌道高度(400km)>>大気厚さ(10km)

科学目的

- 基本研究: 極限エネルギー粒子による新天文学
 - 高統計到来方向解析による起源天体の同定
 - 個別天体からのエネルギースペクトル測定による加速・放射機構の検証
- 探求的試験研究
 - 極限エネルギー宇宙ガンマ線の測定
 - 極限エネルギー宇宙ニュートリノの検出
 - 銀河磁場の構造と強度の推定
 - 相対論、量子重力効果の検証
 - 大気圏発光現象の研究

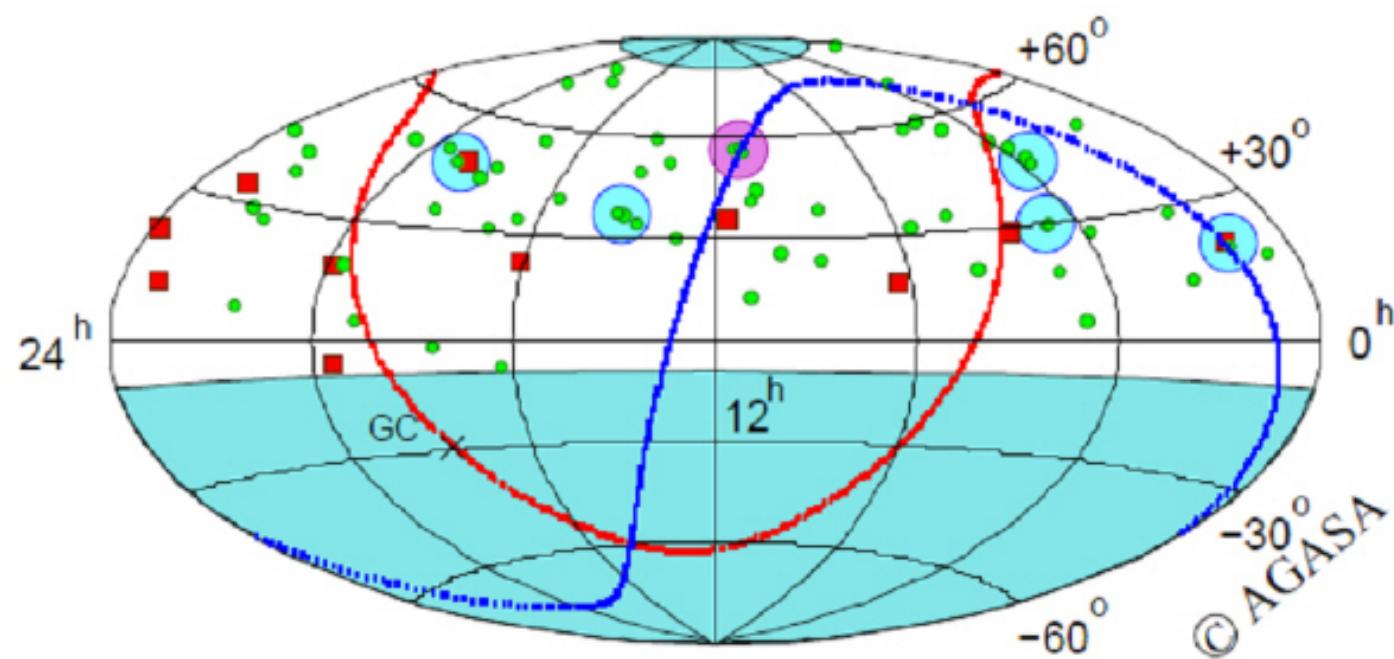

$E > 10^{20}$ eV 粒子は曲がらない

銀河内の伝播シミュレーション

到来方向解析により起源天体を特定：粒子天文学

Arrival Directions (AGASA)

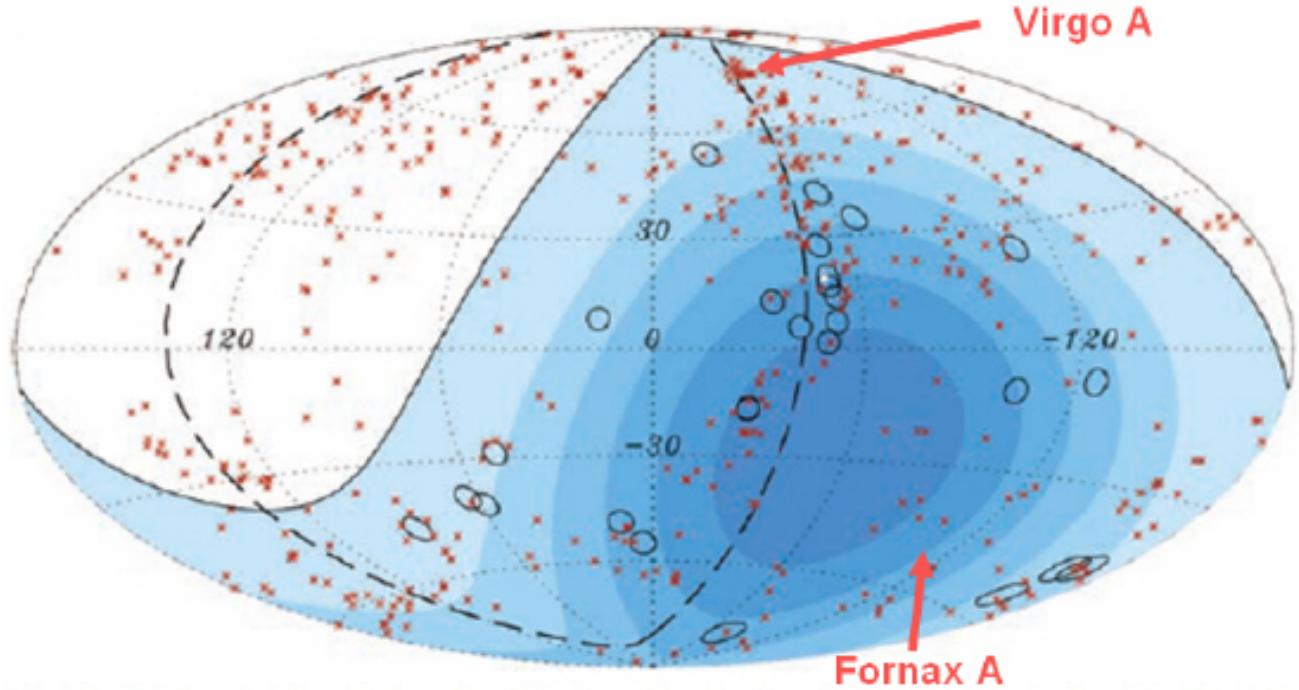

Fig. 2. Aitoff projection of the celestial sphere in galactic coordinates with circles of radius 3.1° centered at the arrival directions of the 27 cosmic rays with highest energy detected by the Pierre Auger Observatory. The positions of the 472 AGN (318 in the field of view of the Observatory) with redshift $z \leq 0.018$ ($D < 75$ Mpc) from the 12th edition of the catalog of quasars and active nuclei (12) are indicated by red asterisks. The solid line represents the border of the field of view (zenith angles smaller than 60°). Darker color indicates larger relative exposure. Each colored band has equal integrated exposure. The dashed line is the supergalactic plane. Centaurus A, one of our closest AGN, is marked in white.

- **JEM-EUSO “slow-data”**

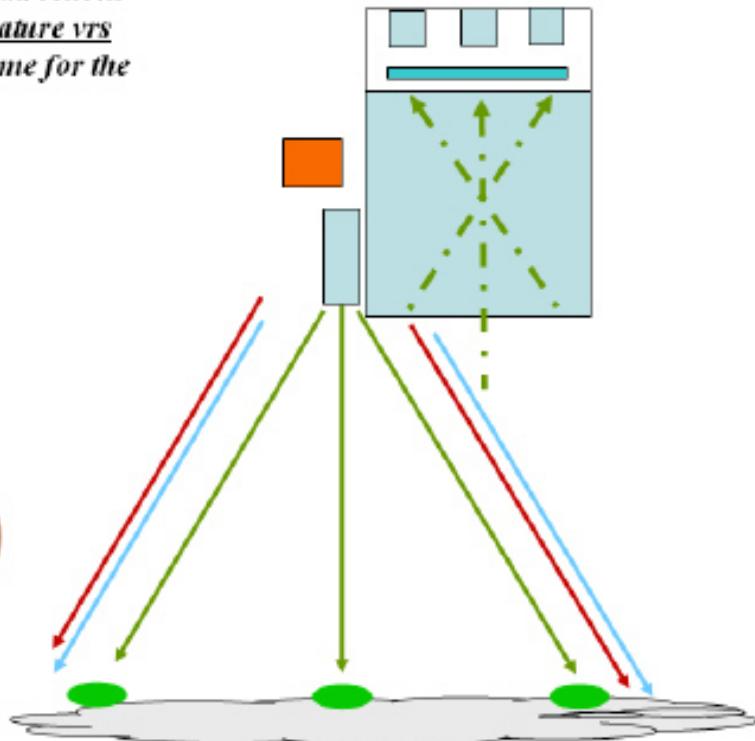

Continuous background photon counting

JEM-EUSO ISS motion →

- *Cloud amount, cloud top altitude:* (IR cam., Lidar, slow-data)
- *Airglow:* (slow-data)
- *Calibration of telescope:* (Lidar)

*Using the measurements in these three-four directions
for calibration of the IR radiometer temperature vts
cloud top altitude – Reference lines ; the same for the
UV « slow mode »*

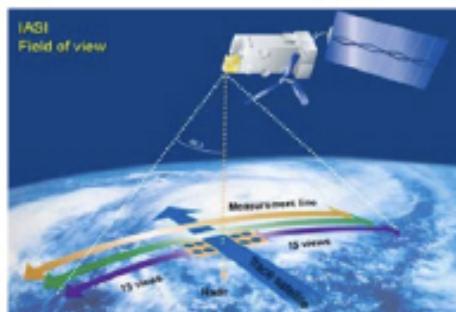

IR Camera

Requirement

Item	Value	Reason
Wavelength	10 – 13 μm	Atmospheric transmission, S/N
FOV	> 60°	Same FOV as JEM-EUSO
Spatial Resolution	0.25°	1.8 km/pix @ nadir
Observation Temperature Range	200 – 320 K	Cloudtop temperature in troposphere
Absolute Temperature Resolution	< 3 K	Altitude resolution < 500m
IR Sensor	Uncooled Microbolometer Array	Mass, Power
Exposure Time	133 msec	ISS motion within $\frac{1}{2}$ - pix of IR camera
Observation Interval	30 sec (5 sec TBC)	ISS motion of JEM-EUSO $\frac{1}{2}$ FOV

IR Camera Development with EADS/SODERN

CIM01 (or IASI) onboard METOP1 satellite

IASA Specification

- Scanning Mirror
- Sensor (CIM01)

$\lambda :$ 10.3 - 12.5

μm

sensor: bolometer array

pix. size: 64×64

res.: 12 bit

FOV: $60 \times 60 \text{ mrad}$

NETD : $<80 \text{ mK}$

IR Camera Development with EADS/SODERN

Major Change from CIM01 to JEM-EUSO IR Camera

(1) Pixel size of detector

" 64×64 " → " 320×240 "

Boeing U3000A (320x240)

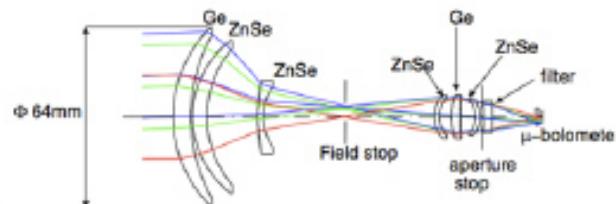

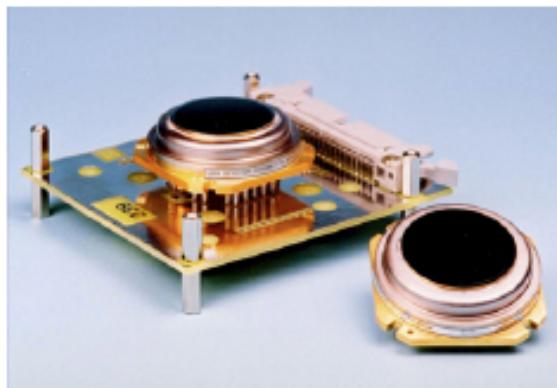

(2) FOV

Line scanning → $>60^\circ$

Based on CIM01 design, they can produce FM of JEM-EUSO IR camera with 5.5MEuro within 5 years.

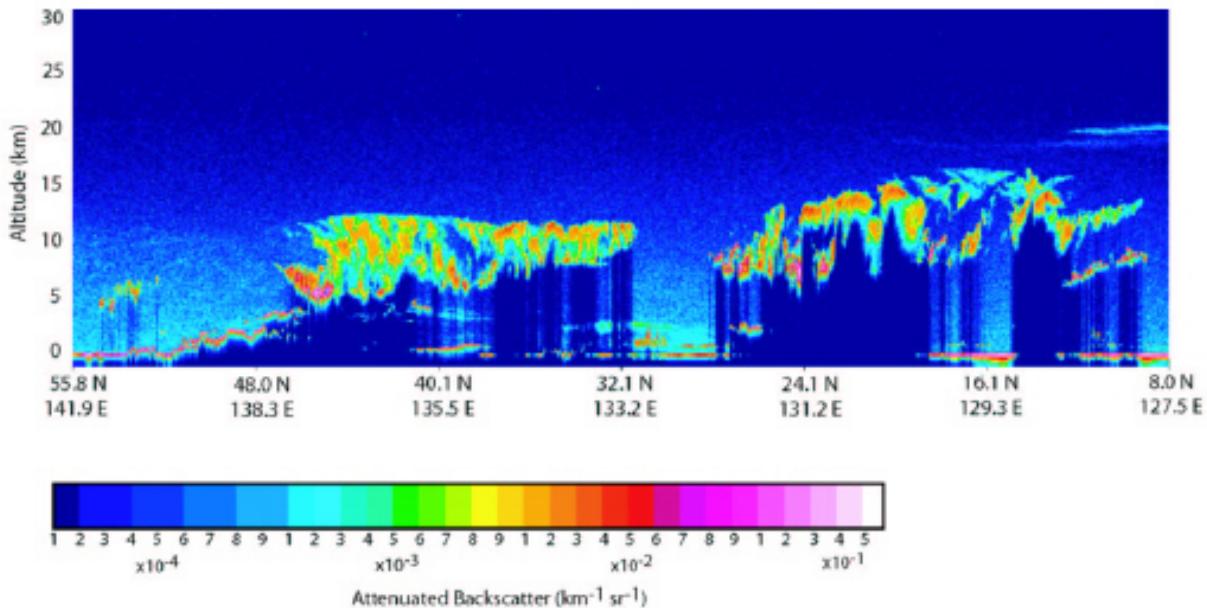

Specification of IR Camera

Should be determined before 12E, 2007

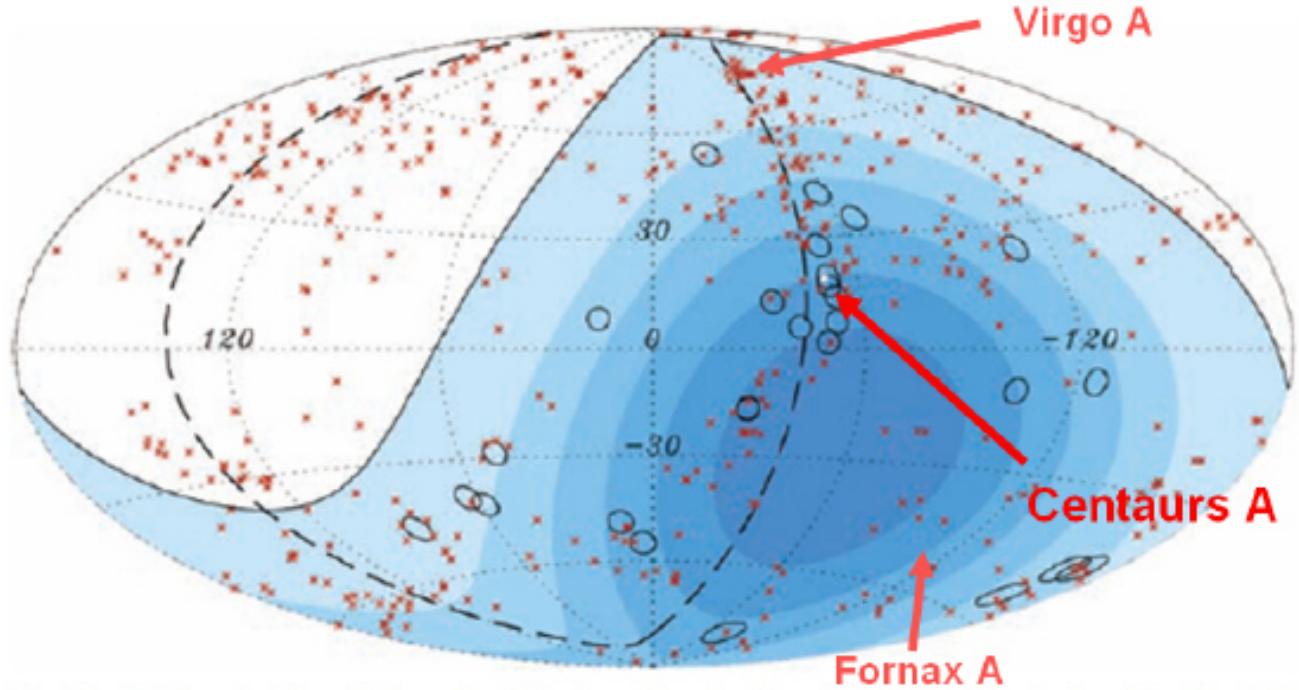

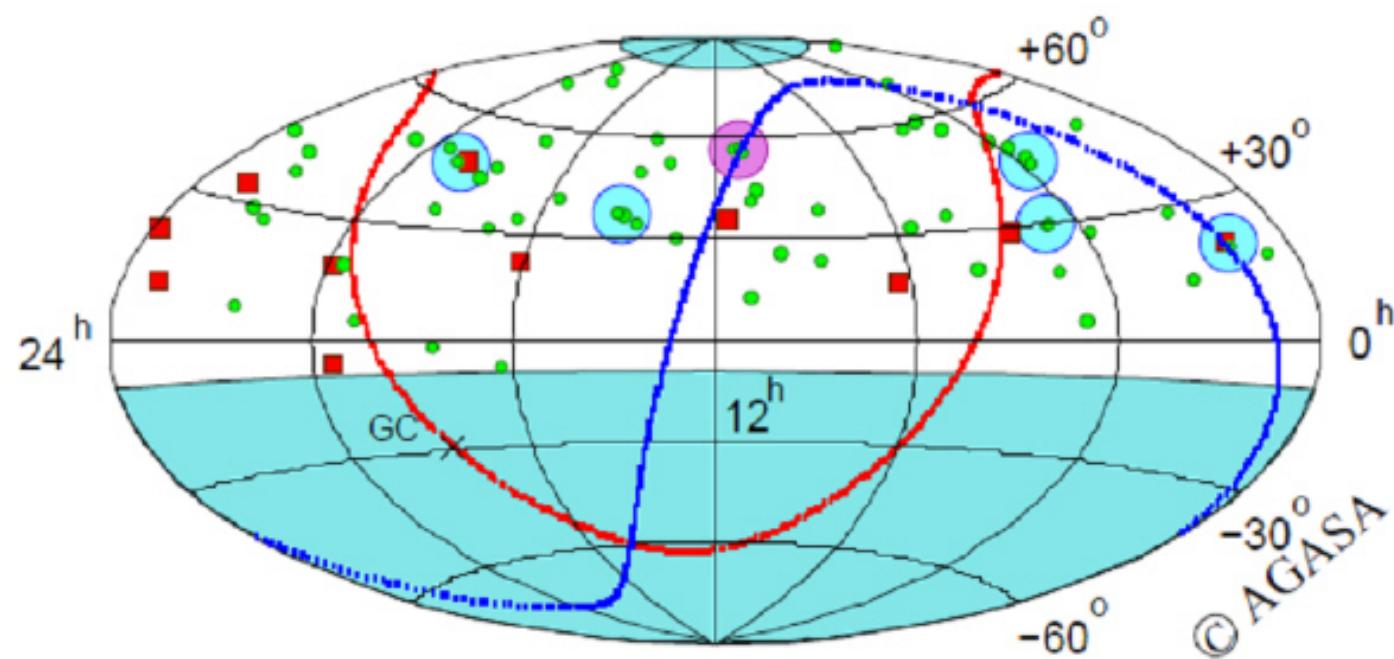

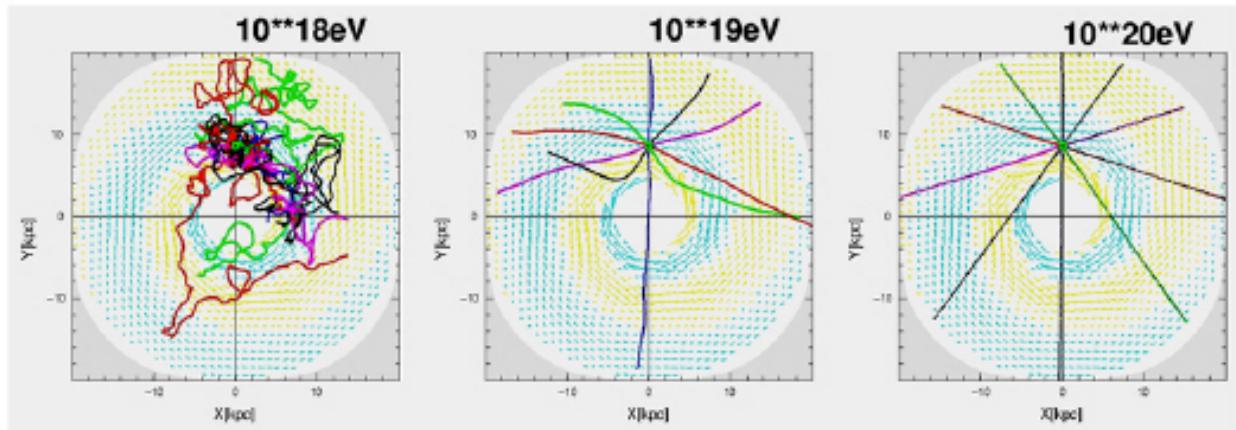

Fig. 2. Aitoff projection of the celestial sphere in galactic coordinates with circles of radius 3.1° centered at the arrival directions of the 27 cosmic rays with highest energy detected by the Pierre Auger Observatory. The positions of the 472 AGN (318 in the field of view of the Observatory) with redshift $z \leq 0.018$ ($D < 75$ Mpc) from the 12th edition of the catalog of quasars and active nuclei (12) are indicated by red asterisks. The solid line represents the border of the field of view (zenith angles smaller than 60°). Darker color indicates larger relative exposure. Each colored band has equal integrated exposure. The dashed line is the supergalactic plane. Centaurus A, one of our closest AGN, is marked in white.

Arrival Directions (AGASA)

$E > 10^{20}$ eV 粒子は曲がらない

銀河内の伝播シミュレーション

到来方向解析により起源天体を特定：粒子天文学

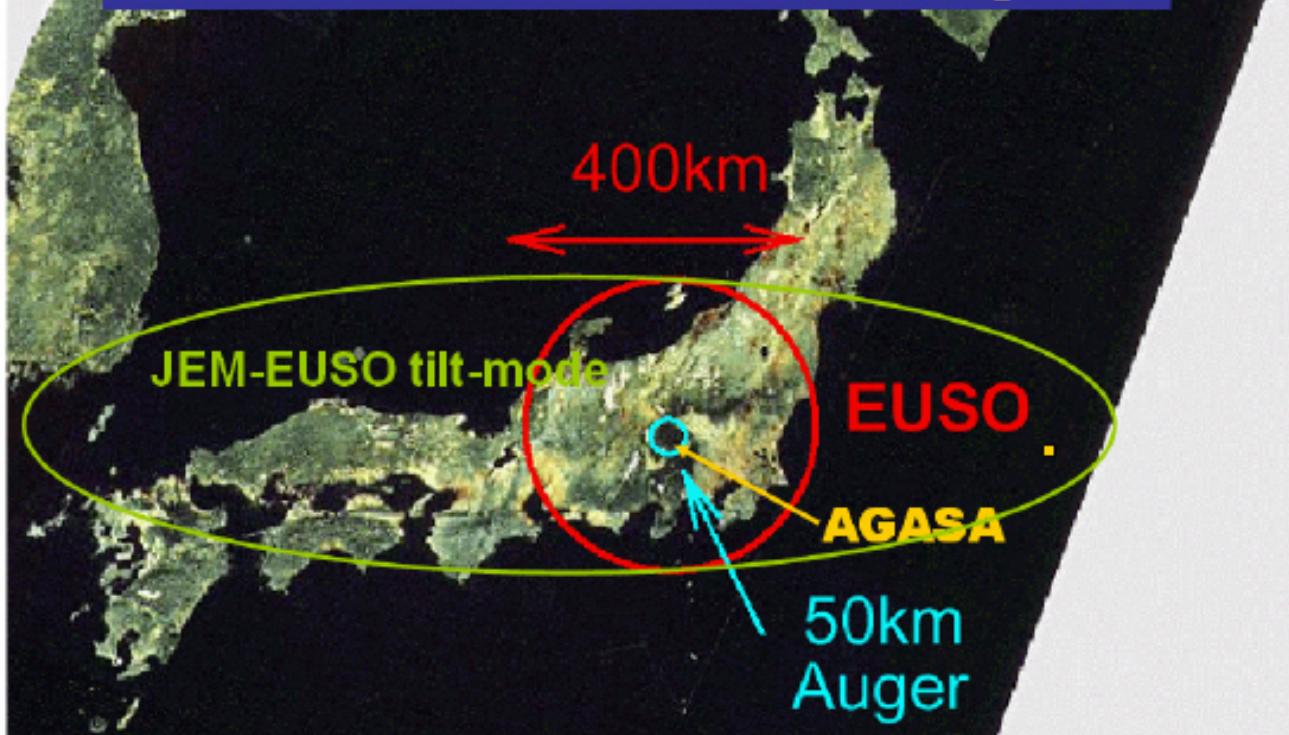

科学目的

- 基本研究: 極限エネルギー粒子による新天文学
 - 高統計到来方向解析による起源天体の同定
 - 個別天体からのエネルギースペクトル測定による加速・放射機構の検証
- 探求的試験研究
 - 極限エネルギー宇宙ガンマ線の測定
 - 極限エネルギー宇宙ニュートリノの検出
 - 銀河磁場の構造と強度の推定
 - 相対論、量子重力効果の検証
 - 大気圏発光現象の研究

Light Curve (Photon)

宇宙から見る利点

- 上層大気は希薄で散乱が少ない
 - 地上からだと汚い下層大気の吸収をこうむる
 - 10km先だと10%以下
- 夜は雲頂高度が低い
 - ほとんどは<3km
 - 空気シャワーの大部分は雲の上で最大を迎える
- 距離が決まっている
 - 軌道高度(400km)>>大気厚さ(10km)

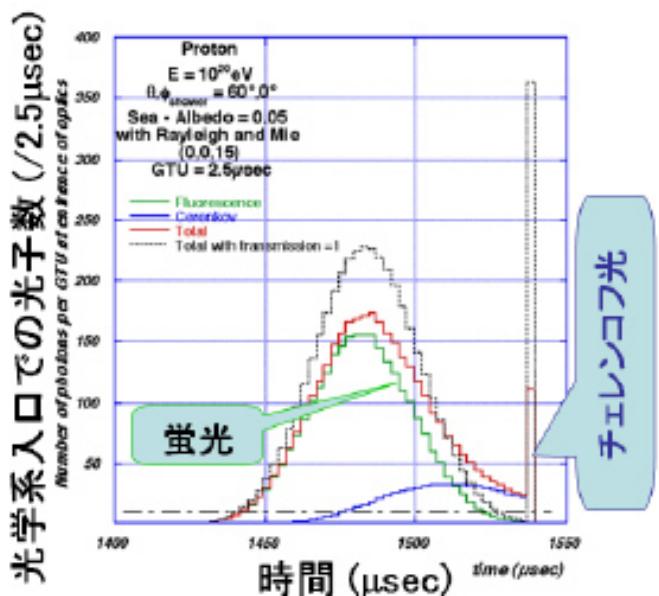

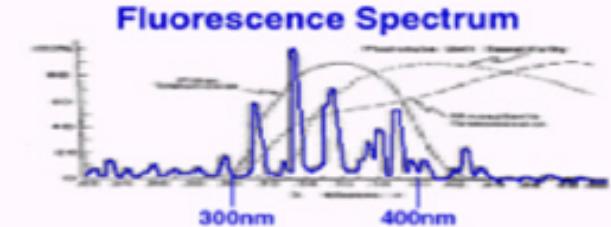

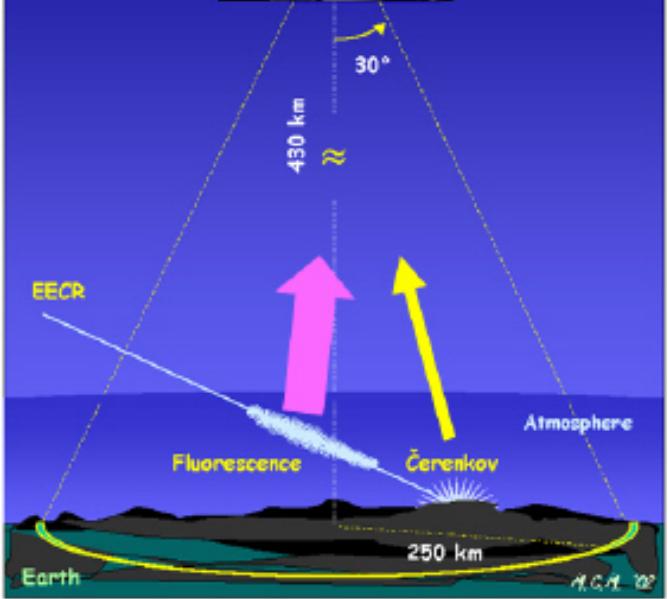

EUSOの観測方法

宇宙線が大気中に飛び込んで来て、空気シャワーをつくり、シャワー中の電子が窒素や窒素イオンを励起して蛍光を発する。

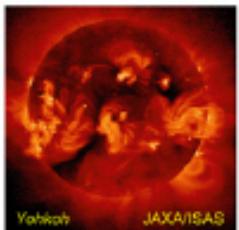

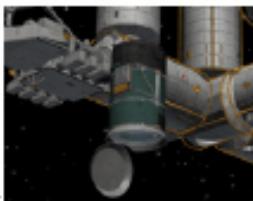

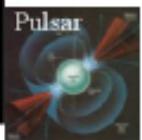

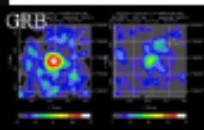

この蛍光を口径2.5mの望遠鏡で観測する。

空気シャワーにそって発せられたチエレンコフ光の地上や海上での反射光を観測する。
