

High Speed with High-level Languages

Koichi Nakamura

Graduate School of Information Science and Technology
The University of Tokyo

Current Problems

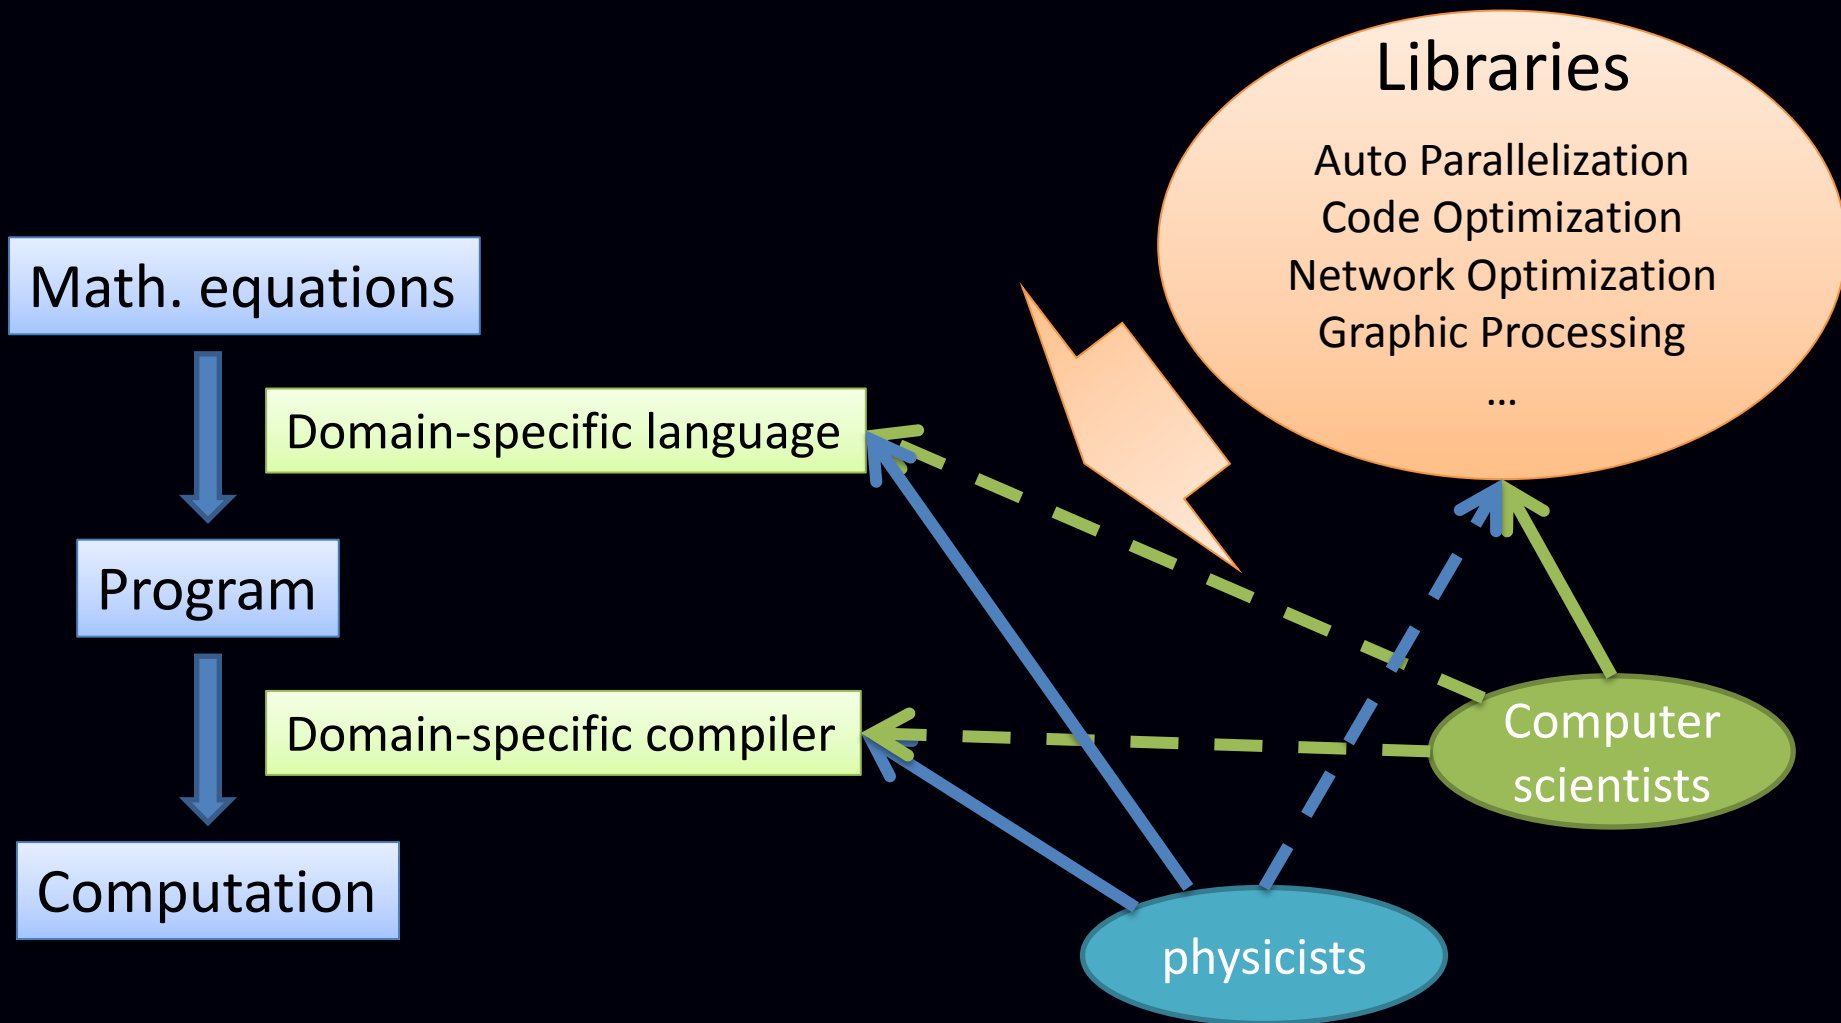

Misunderstandings

1. Very high-level languages are sloooowww
2. Meta programming is sloooowww
3. Dynamic programming languages are sloooowww

Corrections

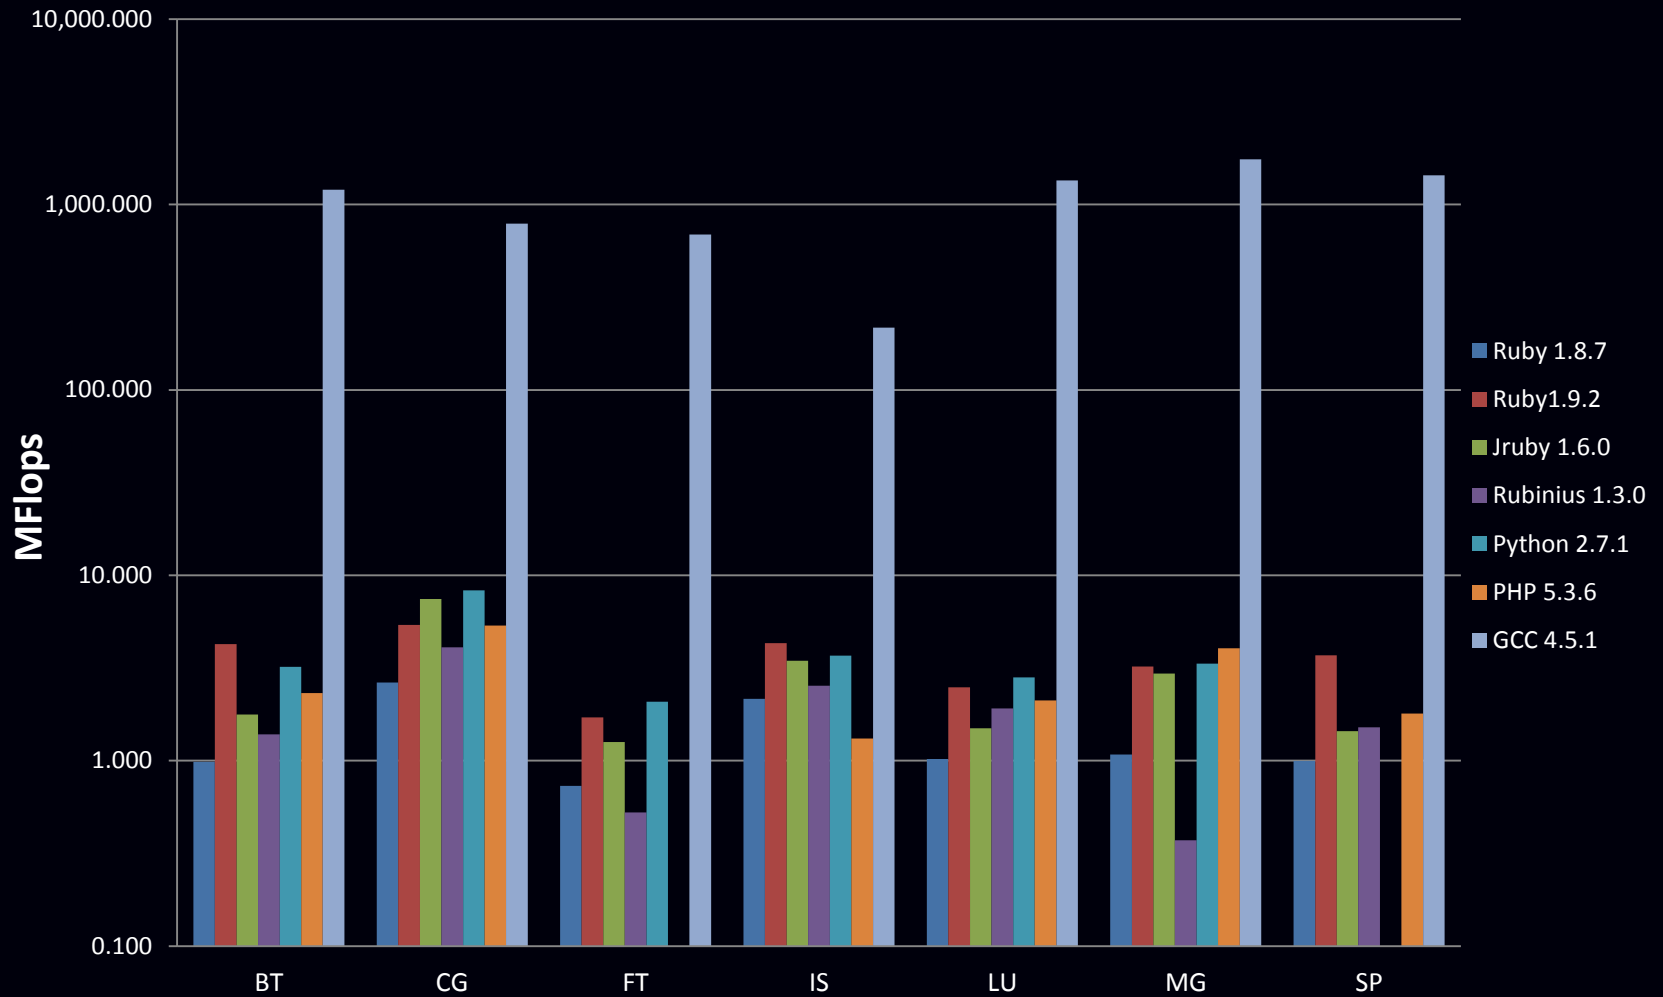

1. Very high-level languages can be **fast**
2. Meta programming can be **fast**
3. Dynamic programming languages can be **fast**

New Proposal

HPC Ruby compiler

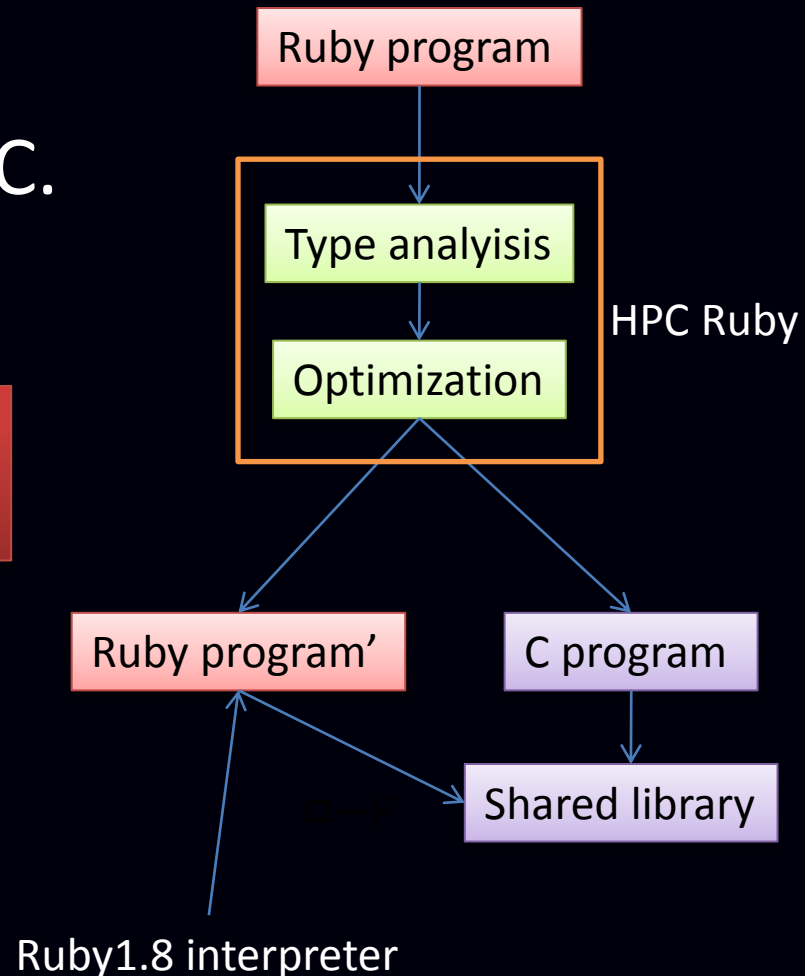

Nas Parallel Benchmarks [Nose2011]

HPC Ruby compiler

- Ahead Of Time (AOT) compilation from Ruby to C.
- Usage

```
% rubyc foo.rb -o foo_opt.rb  
% ruby foo_opt.rb
```

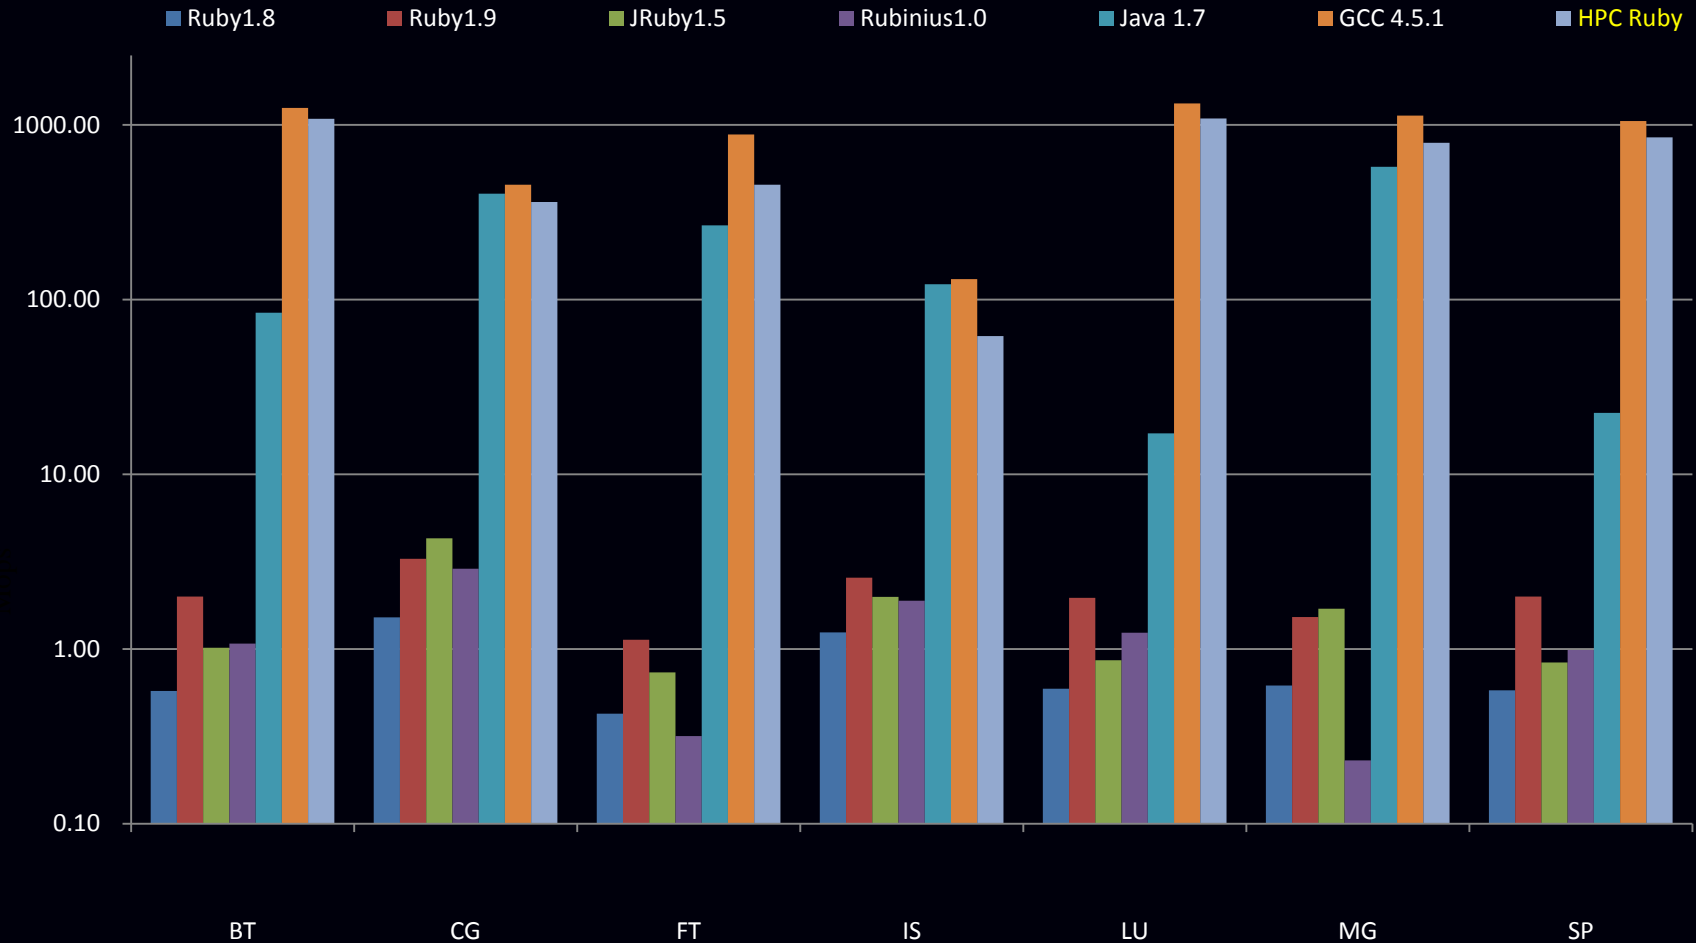

Why Ruby?

- High popularity
- Very high productivity
- Easy to use
- Dynamic code generation mechanism

Why Ruby?

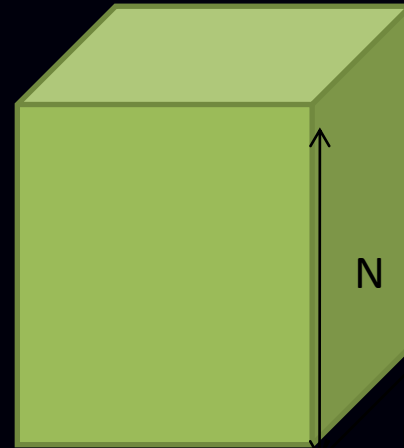

Nas Parallel Benchmarks [Nakamura 2011]

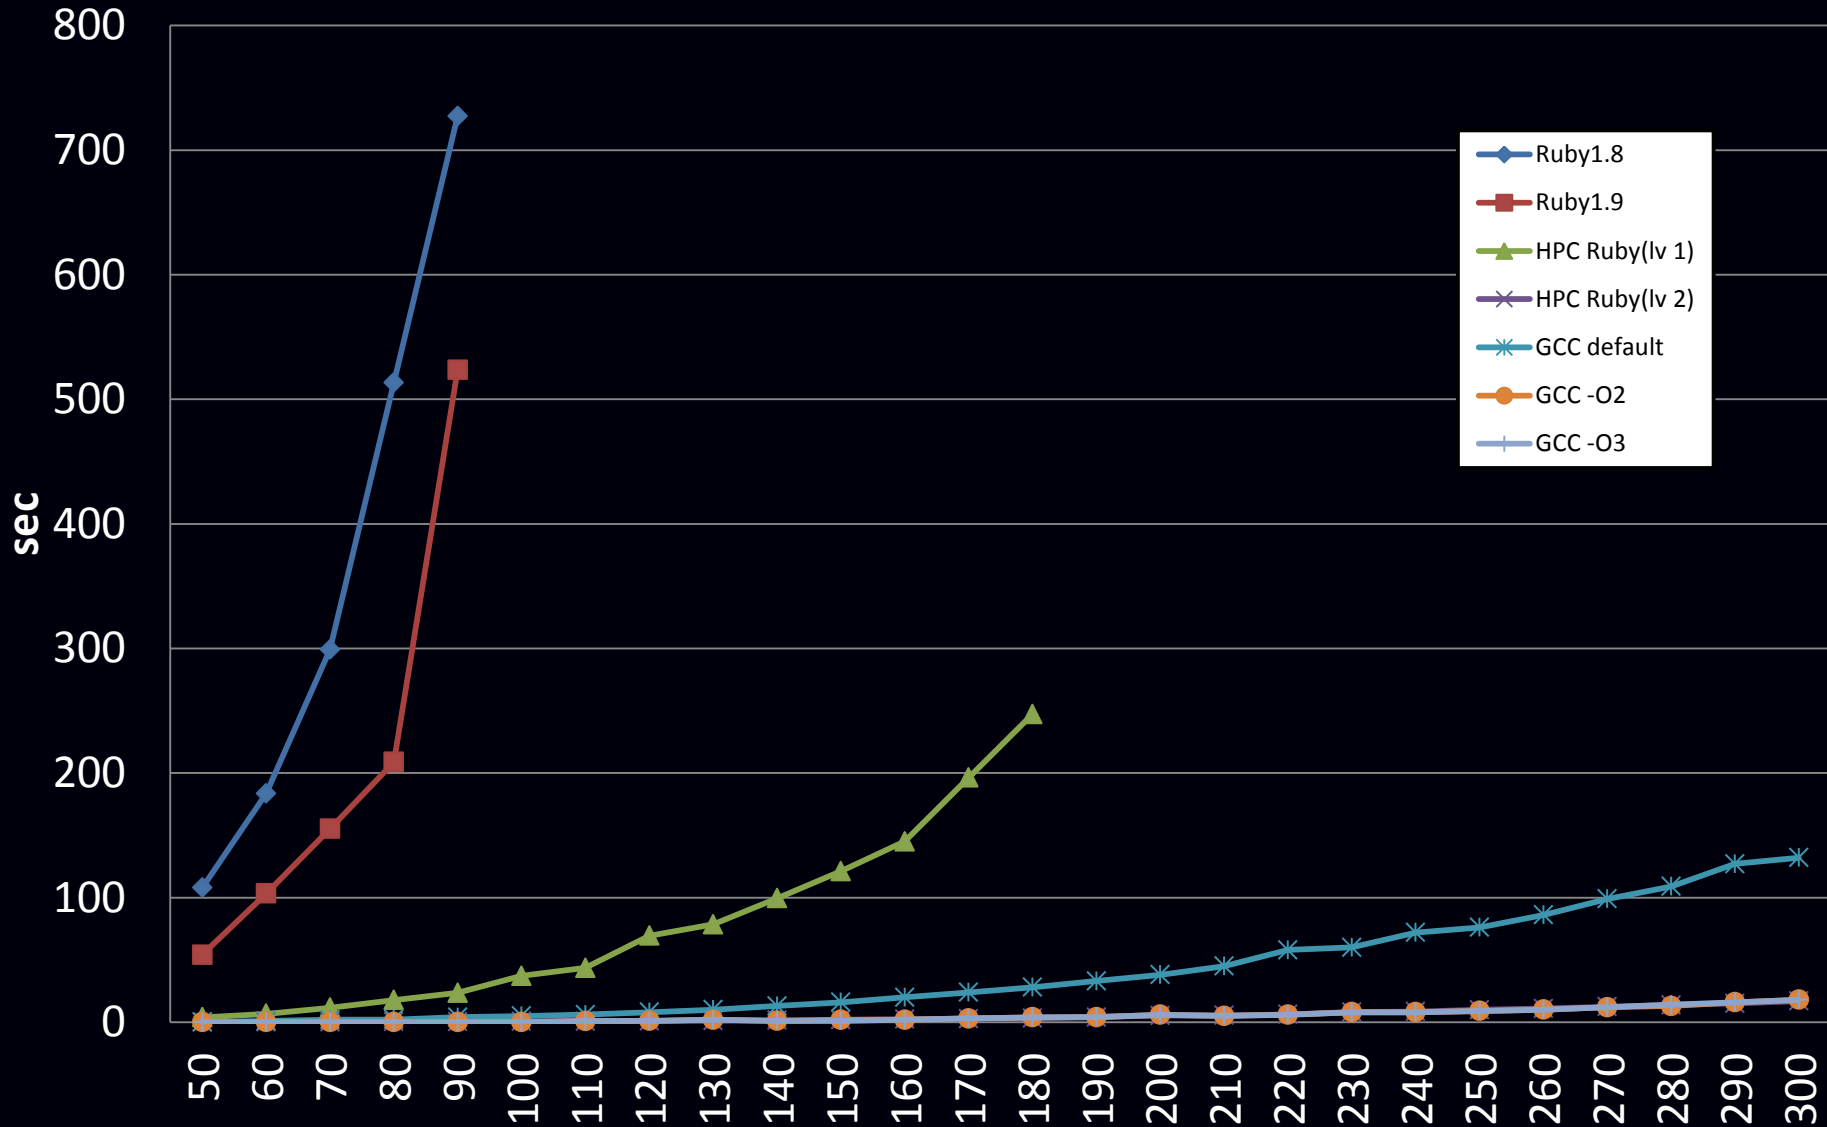

Benchmark 2

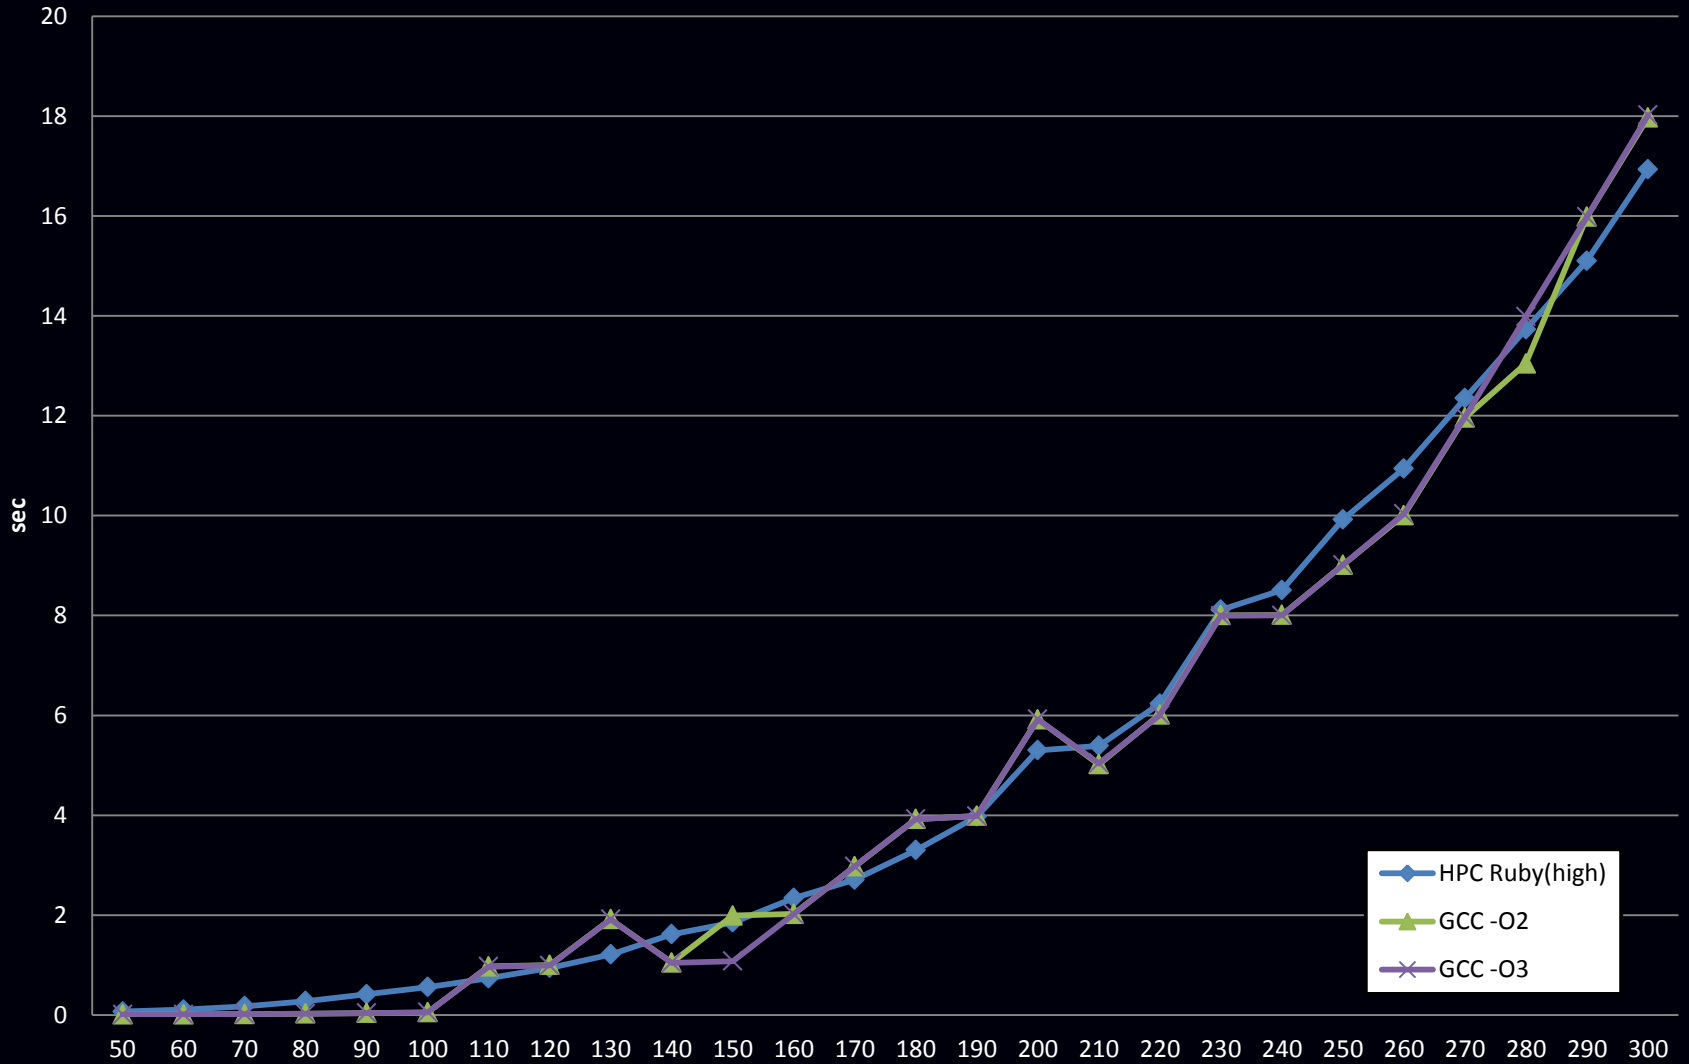

- Calculation of Thermal Diffusion Equation
 - 3D cubic space
 - 100 steps
 - complexity: $O(N^3)$

Execution Time

Execution Time

Million FLOPS
